1 INTRODUCTION

Since 2005, the Institute for Interlaboratory Studies organizes every year a proficiency test for Gasoil B5 (5% FAME) according EN590:2004. In the annual proficiency testing program of 2009/2010, it was decided to change this into a round robin for the analysis of Gasoil B10 (10% FAME).

In this interlaboratory study, 56 laboratories from 26 countries have participated. See appendix 3 for a list of participants in alphabetical country order.

In this report, the results of the Gasoil B10 (10% FAME) proficiency test are presented and discussed.

2 SET UP

The Institute for Interlaboratory Studies (iis) in Spijkenisse, The Netherlands, was the organizer of this proficiency test. It was decided to evaluate the B10 diesel according the two different test scopes of ASTM D7467 and EN590.

Analyses for fit-for-use and homogeneity testing were subcontracted.

Participants were requested to report rounded and unrounded results. The unrounded results were preferably used for statistical evaluation.

2.1 ACCREDITATION

The Institute for Interlaboratory Studies in Spijkenisse, the Netherlands, is accredited in agreement with ISO guide 43 and ILAC-G13:2007, (R007), since January 2000, by the Dutch Accreditation Council (Raad voor Accreditatie). This ensures 100% confidentiality of participant's data. Also customer's satisfaction is measured on a regular basis by sending questionnaires.

2.2 PROTOCOL

The protocol followed in the organization of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organization, Statistics and Evaluation' of January 2010 (iis-protocol, version 3.2), which can be downloaded from www.iisnl.com. The participants were asked to report the analytical results using the indicated units on the report form.

2.3 CONFIDENTIALITY STATEMENT

All data present in this report must be regarded as confidential and for use by the participating companies only. Disclosure of the information in this report is only allowed by means of the entire report. Use of the contents of this report for third parties is only allowed by written permission of the Institute for Interlaboratory Studies. Disclosure of the identity of one or more of the participating companies will be done only after receipt of a written agreement of the companies involved.

2.4 SAMPLES

The necessary bulk material (Gasoil B5 with approx. 5% FAME) was purchased from a local Gasoil producer. To 190 litre of the bulk material 10 litre of FAME (B100) was added to increase the FAME content upto 10%.

After homogenization, 105 subsamples were transferred to 1 litre brown glass bottles and labelled #1039. Another 104 bottles of 500 mL (also labelled #1039) were subsequently filled and another 60 bottles of one litre (labelled #1040) were filled with 850 mL of material each. The homogeneity of the subsamples #1039 was checked by determination of Density in accordance with ASTM D4052:09 and FAME content in accordance with EN14078:03 on 10 stratified randomly selected samples.

	<i>Density @ 15 °C in kg/L</i>	<i>FAME in %M/M</i>
sample #1039-1	0.84617	9.34
sample #1039-2	0.84616	9.33
sample #1039-3	0.84612	9.34
sample #1039-4	0.84617	9.33
sample #1039-5	0.84614	9.32
sample #1039-6	0.84617	9.32
sample #1039-7	0.84614	9.32
sample #1039-8	0.84617	9.33
sample #1039-9	0.84615	9.32
sample #1039-10	0.84618	9.33

table 1: homogeneity test results of subsamples #1039

From the above test results, the repeatabilities were calculated and compared with 0.3 times the corresponding reproducibilities in agreement with the procedure of ISO 13528, Annex B2 in the next table:

	<i>Density @ 15 °C in kg/L</i>	<i>FAME in %V/V</i>
r (sample #1039)	0.00005	0.02
reference test	ISO12185:96	EN14078:03
r (reference test)	0.00015	0.27

table 2: repeatabilities of the subsamples #1039

The calculated repeatability was less than 0.3 times the reproducibility of the reference method. Therefore, homogeneity of the subsamples #1039 was assumed.

For Total Contamination, each bottle labelled #1040 was spiked with 1 ml of a freshly prepared and well shaken suspension. This suspension was prepared from 0.88 g BCR-067 (ϕ 2.4-32 μ m) and 0.87 g BCR-070 (ϕ 1.2-20 μ m) and 87.67 g oil.

The homogeneity was checked by weighing the bottles before and after addition.

Two bottles (1x1L + 1x0.5L, labelled #1039) and/or one bottle of 1L, labelled #1040 were sent to the participating laboratories on April 24, 2010.

2.5 STABILITY OF THE SAMPLES

The stability of Gasoil B10, packed in the brown glass bottles, was checked. The material was found sufficiently stable for the period of the proficiency test.

2.6 ANALYSIS

The participants were asked to determine, according specifications ASTM D7467 and EN590: Ash Content, Aromatics by FIA, Cetane Index ISO4264, Cold Filter Plugging Point, Conradson Carbon Residue on 10% Residue, Ramsbottom Carbon Residue on 10% Residue, Copper Corrosion, Density @ 15°C, Distillation, FAME, Flash Point PMcc, Kinematic Viscosity @40°C, Lubricity, Oxidation Stability, Polycyclic Aromatic Hydrocarbons, Pour Point, Sulphur Content, TAN, Total Contamination and Water. To get comparable results a detailed report form, on which the units were prescribed as well as some of the required standards, was sent together with each set of samples. Also, a letter of instructions and a SDS were added to the package.

3 RESULTS

During four weeks after sample despatch, the results of the individual laboratories were gathered. The original data are tabulated per determination in the appendix 1 of this report. The laboratories are presented by their code numbers.

Directly after deadline, a reminder fax was sent to those laboratories that had not yet reported.

Shortly after the deadline, the available results were screened for suspect data. A result was called suspect in case the Huber Elimination Rule (a robust outlier test) found it to be an outlier. The laboratories that produced these suspect data were asked to check the (raw data of the) reported results. Additional or corrected results have been used for data analysis and the original results are placed under 'Remarks' in the result tables in appendix 1.

3.1 STATISTICS

Statistical calculations were performed as described in the report 'iis Interlaboratory Studies: Protocol for the Organization, Statistics and Evaluation' of January 2010 (iis-protocol, version 3.2).

For the statistical evaluation the *unrounded* (when available) figures were used instead of the rounded results. Results reported as '<...' or '>...' were not used in the statistical evaluation.

First, the normality of the distribution of the various data sets per determination was checked by means of the Lilliefors-test. After removal of outliers, this check was repeated. Not all data sets proved to have a normal distribution, in which cases the conclusions of statistical evaluation should be used with due care.

In accordance with ISO 5725 (1986 and 1994) the original results per determination were submitted subsequently to Dixon and Grubbs outlier tests.

Outliers are marked by D(0.01) for the Dixon test, by G(0.01) or DG(0.01) for the Grubbs test. Stragglers are marked by D(0.05) for the Dixon test, by G(0.05) or DG(0.05) for the Grubbs test. Both outliers and stragglers were not included in the calculations of averages and standard deviations.

Finally, the reproducibilities were calculated from the standard deviations by multiplying them with a factor of 2.8.

3.2 GRAPHICS

In order to visualize the data against the reproducibilities from literature, Gauss plots were made, using the sorted data for one determination (see appendix 1). On the Y-axis the reported analysis results are plotted. The corresponding laboratory numbers are under the X-axis.

The straight horizontal line presents the consensus value (a trimmed mean). The four striped lines, parallel to the consensus value line, are the +3s, +2s, -2s and -3s target reproducibility limits of the selected standard. Outliers and other data, which were excluded from the calculations, are represented as a "x". Accepted data are represented as a triangle. Furthermore, Kernel Density Graphs were made. This is a method for producing a smooth density approximation to a set of data that avoids some problems associated with histograms (see appendix 3; nr.13 and 14).

3.3 Z-SCORES

To evaluate the performance of the participating laboratories the z-scores were calculated. As it was decided to evaluate the performance of the participants in this proficiency test (PT) against the literature requirements, e.g. EN reproducibilities, the z-scores were calculated using a target standard deviation. This results in an evaluation independent of the spread of this interlaboratory study. The target standard deviation was calculated from the literature reproducibility by division with 2.8. The z-scores were calculated according to:

$$z_{(\text{target})} = (\text{result} - \text{average of PT}) / \text{target standard deviation}$$

The $z_{(\text{target})}$ scores are listed in the result tables in appendix 1.

Absolute values for $z < 2$ are very common and absolute values for $z > 3$ are very rare.

Therefore, the usual interpretation of z-scores is as follows:

$ z < 1$	good
$1 < z < 2$	satisfactory
$2 < z < 3$	questionable
$3 < z $	unsatisfactory

4 EVALUATION

In this interlaboratory study, no problems with sample despatch were encountered during the execution. Two participants decided not to report any results. In total eleven participants reported results after the final reporting date. Finally, 55 participants reported in total 1023 numerical results. Observed were 39 outlying results, which is 3.8%. In proficiency studies, outlier percentages of 3 % - 7.5 % are quite normal.

Not all original data sets proved to have a normal distribution. For Calculated Cetane Index ISO4264, Cloud Point, Cold Filter Plugging Point, Density, Flash Point, Oxidation Stability in g/m³, and Pour Point (manual and automated) non-Gaussian distributions were found. Therefore, the statistical evaluation for these determinations should be used with care.

4.1 EVALUATION PER TEST

In this section, the results are discussed per test.

Ash: No significant conclusions were drawn as the consensus value is below the application range of the reference method. All participants agreed that ash was equal or less than 0.001 %M/M.

Aromatics (FIA): This determination may be problematic. No statistical outliers were detected, but the results vary over a large range (19.0 – 38.22 %V/V). The calculated reproducibility is not at all in agreement with ASTM D1319:08, but the precision and bias of D1319 with biodiesel blends is not known and is currently under investigation, see paragraph X1.11.1 of ASTM D7467:09a.

C.I. D976: This determination was not problematic. No statistical outliers were observed and the observed reproducibility is in good agreement with the requirements of ASTM D976:06.

C.I. ISO4264: Regretfully, no reproducibility limits are mentioned in ISO4264:07. It should be noted that the ASTM has repeatedly amended the calculations routines in ASTM D4737 to incorporate the various diesel oil specifications mentioned in ASTM D975. The last update of ISO 4264 was in 2007, which is the current version (and technically equivalent to the 1996a version of ASTM D4737). In ISO 4264 only one calculation routine is mentioned and in the latest ASTM D4737 (2004 version) two calculation routines are mentioned. The user should take care to use and report the correct method as required by clients.

Cloud Point: This determination was not problematic. Two statistical outliers were detected. However, the calculated reproducibility, after rejection of the statistical outliers, is in good agreement with the requirements of EN23015:94 and/or ASTM D2500:09.

- CFPP: This determination was problematic. No statistical outliers were detected. However, the calculated reproducibility is not at all in agreement with the requirements of EN116:98.
- CCR 10% res.: No significant conclusions were drawn as the carbon residue content was below the application range of the target method. All participants agreed that Conradson Carbon Residue was less than 0.1 %M/M.
- Ramsbottom.: The test results vary over a large range (0.022 – 0.12 %M/M). Still, no conclusions were drawn as only six laboratories reported a test result.
- Copper Corr.: No problems have been observed, all participants agreed on a result of 1.
- Density @15°C: This determination was not problematic. Two statistical outliers were detected. However, the calculated reproducibility, after rejection of the statistical outliers, is in good agreement with the requirements of ISO12185:96.
- FAME: This determination was problematic. Two statistical outliers were detected and the calculated reproducibility, after rejection of the statistical outliers, is not at all in agreement with the requirements of EN14078:03.
- Flash Point: This determination was not problematic. Only one statistical outlier was detected and the calculated reproducibility, after rejection of the statistical outlier, is in good agreement with the requirements of ISO2719:02 and ASTM D93:08.
- Kin. Visc. 40°C: This determination was problematic. Two statistical outliers were detected. The calculated reproducibility, after rejection of the statistical outliers, is not in agreement with the requirements of ISO3104:94 and/or ASTM D445:09.
- Lubricity: This determination was not problematic. Only one statistical outlier was detected and the calculated reproducibility, after rejection of the statistical outlier, is in good agreement with the requirements of ISO12156:97.
- Ox. Stab. EN15751: This determination was problematic for several laboratories. Three laboratories used EN14112, a test method applicable for B100, but not for B10 and three statistical outliers were detected. However, the calculated reproducibility, after rejection of the statistical outliers, is in good agreement with the requirements of EN15751:09
- Ox. Stab. ISO12205: This determination was problematic for several laboratories. Four statistical outliers were detected. However, the calculated reproducibility, after rejection of the statistical outliers, is in good agreement with the requirements of ISO12205:96.

- PAH: This determination was very problematic. Two statistical outliers were detected and the calculated reproducibility, after rejection of the statistical outliers, is not at all in agreement with the requirements of EN12916:06.
- Pour Point (M): This determination was not problematic. No statistical outliers were detected and the calculated reproducibility is in good agreement with the requirements of ASTM D97:09.
- Pour Point (A): This determination was not problematic. No statistical outliers were detected and the calculated reproducibility is in good agreement with the requirements of ASTM D5950:07.
- Sulphur: This determination was not problematic. Two statistical outliers were detected. However, the calculated reproducibility, after rejection of the statistical outliers, is in good agreement with the requirements of ISO20846:04 and/or ASTM D5453:09.
- TAN: This determination was not problematic. Two statistical outliers were detected. However, the calculated reproducibility, after rejection of the statistical outliers, is in good agreement with the requirements of ASTM D664:09a.
- Water: No analytical problems have been observed. Two statistical outliers were detected. However, the calculated reproducibility is in good agreement with the requirements of EN12937:00.
- Distillation: As only three laboratories reported results from a manual distillation, these results are listed and evaluated together with the results of the automated distillation.
Only the initial boiling point was somewhat problematic. In total only four statistical outliers were detected and the calculated reproducibilities of 10% rec., 50% rec., 90% rec., 95% rec, vol. @250° and vol. @350°, after rejection of the statistical outliers, are all in good agreement with the requirements of ISO/DIS3405:09 (auto) and/or ASTM D86:09e1 (auto).
- Total Contamination: Serious analytical problems for several laboratories have been observed. The samples were spiked with a freshly prepared and well shaken suspension of particulate quartz material (\varnothing 1.2-32 μm) in oil. And therefore the minimum Total Contamination concentration to be found was known (added upto concentration of 25.2 mg/kg). The laboratories should be able to find at least 17.6 mg/kg [25.2 mg/kg (added) – 7.6 mg/kg (R EN12662)].
However, five laboratories reported TC results lower than 17.6 mg/kg. These low results were rejected prior to data analysis. The reason for the low TC results found may be insufficient homogenisation of the sample by the respective laboratory prior to sub sampling for analysis.

After exclusion of the suspicious data and the four statistical outliers, the calculated reproducibility of the remaining 15 test results is in good agreement with the requirements of EN12662:08. The average recovery (consensus value / spiked amount) is good (<101%)

4.2 PERFORMANCE EVALUATION FOR THE GROUP OF LABORATORIES

A comparison has been made between the reproducibility as declared by the relevant standard and the reproducibility as found for the group of participating laboratories that participated. The average results of the evaluated parameters, calculated reproducibilities and reproducibilities, derived from literature standards (in casu ASTM, EN or ISO standards) are compared in the next tables.

Parameters	unit	n	average	2.8 * sd	R (lit)
Ash content	%M/M	12	0.0007	0.0008	(0.0050) *
Aromatics by FIA	%V/V	15	28.1	17.5	unknown
Cetane Index D976		9	50.74	0.58	2.00
Cetane Index ISO4264		37	50.30	0.69	unknown
Cloud Point	°C	39	-5.42	3.28	4.00
Cold Filter Plugging Point	°C	42	-22.93	8.53	4.94
CCR on 10% residue	%M/M	23	0.028	0.039	(0.022) *
Ramsbottom CR on 10% residue	%M/M	6	0.069	0.096	0.030
Density @ 15 °C	kg/m ³	50	846.14	0.26	0.50
Fatty Acid Methyl Ester	%V/V	42	9.15	1.13	0.68
Flash Point PMcc	°C	49	60.87	3.63	4.32
Kinematic Viscosity @ 40 °C	mm ² /s	44	2.9572	0.0392	0.0324
Lubricity	µm	30	199.3	80.9	102.0
Oxidation Stability EN15751	hrs	13	37.02	6.58	7.42
Oxidation Stability ISO12205	g/m ³	12	1.74	2.52	6.85
Polycyclic Aromatic Hydrocarbons	%M/M	24	2.00	1.36	0.84
Pour Point (manual)	°C	19	-34.11	6.39	6.60
Pour Point (automated)	°C	15	-33.47	4.47	4.50
Sulphur	mg/kg	41	8.86	1.81	2.11
Total Acid Number	mgKOH/g	23	0.019	0.016	0.144

10% recovery	°C	47	215.69	5.06	4.74
50% recovery	°C	48	277.98	2.68	2.97
90% recovery	°C	48	340.30	3.65	5.10
95% recovery	°C	46	352.48	6.02	8.98
Volume @250°C	%V/V	47	30.76	2.13	2.66
Volume @350°C	%V/V	46	94.30	1.80	2.66

Table 4: summary of test results of Gasoil samples #1039

*) consensus value is below application range of the test method

Without further statistical calculations, it can be concluded that for most tests there is a good compliance of the group of participating laboratories with the relevant standards. The problematic tests have been discussed in paragraph 4.1.

4.3 COMPARISON OF THE INTERLABORATORY STUDY OF APRIL 2010 WITH PREVIOUS PTS.

	April 2010	April 2009	April 2008	April 2007	April 2006
Number of reporting labs	55	69	75	69	42
Number of results reported	1023	1059	1136	1122	675
Statistical outliers	39	54	38	34	28
Percentage outliers	3.8%	5.1%	3.3%	3.0%	4.1%

table 5: comparison with previous proficiency tests.

In proficiency tests, outlier percentages of 3% - 7.5% are quite normal.

The performance of the determinations of the proficiency tests was compared against the requirements of the respective standards. The conclusions are given the following table:

	April 2010	April 2009*	April 2008*	April 2007*	April 2006*
Ash content	(++)	(++)	(++)	(++)	(++)

Water content	++	++	++	++	++
Distillation	+/-	++	+/-	++	++

table 6: comparison determinations against the standard

* NB.: in 2006-2009 B5 was evaluated, not B10

The performance of the determinations against the requirements of the respective standards is listed in the above table. The following performance categories were used:

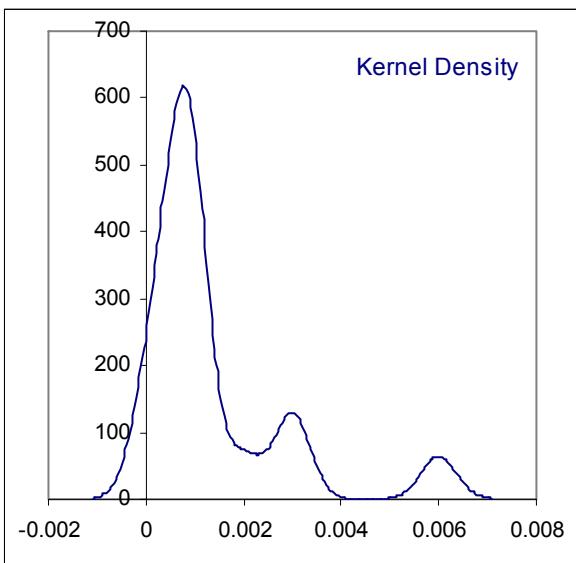

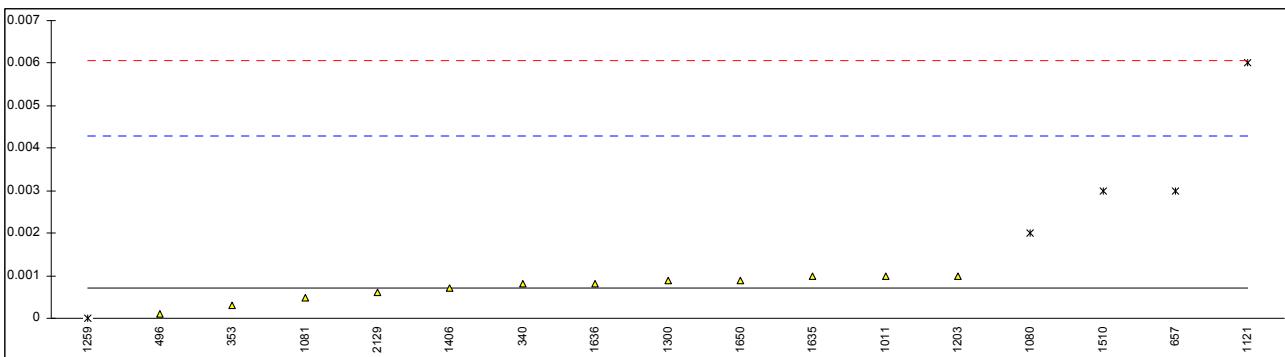

- ++: group performed much better than the standard
- + : group performed better than the standard
- +/-: group performance equals the standard

- : group performed worse than the standard
- : group performed much worse than the standard
- n.e.: not evaluated

APPENDIX 3**Number of participants per country**

1 lab in ARGENTINA
2 labs in AUSTRIA
3 labs in BELGIUM
1 lab in BULGARIA
2 labs in CROATIA
1 lab in CYPRUS
2 labs in CZECH REPUBLIC
1 lab in ESTONIA
1 lab in FINLAND
2 labs in FRANCE
3 labs in GERMANY
3 labs in GREECE
2 labs in HUNGARY
2 labs in IRELAND
1 lab in LATVIA
2 labs in POLAND
2 labs in PORTUGAL
2 labs in REPUBLIC OF MACEDONIA
1 lab in SINGAPORE
1 lab in SLOVENIA
2 labs in SPAIN
1 lab in SWEDEN
4 labs in THE NETHERLANDS
4 labs in TURKEY
1 lab in U.S.A.
9 labs in UNITED KINGDOM

APPENDIX 4**Abbreviations:**

C	= final result after checking of first reported suspect result
D(0.01)	= outlier in Dixon's outlier test
D(0.05)	= straggler in Dixon's outlier test
G(0.01)	= outlier in Grubbs' outlier test
G(0.05)	= straggler in Grubbs' outlier test
DG(0.01)	= outlier in Double Grubbs' outlier test
DG(0.05)	= straggler in Double Grubbs' outlier test
ex	= excluded from calculations
E	= error in calculations
n.a.	= not applicable
W	= result withdrawn
SDS	= Safety Data Sheet
