1 INTRODUCTION

Since 2003, the Institute for Interlaboratory Studies organized a proficiency test for the analysis of used Hydraulic Fluid every year. It was decided to continue this interlaboratory study during the annual program 2011/2012. In this interlaboratory study, 38 laboratories from 25 different countries have participated. See appendix 2 for the number of participants per country. In this report, the test results of the interlaboratory study on used hydraulic fluid are presented and discussed.

2 SET UP

The Institute for Interlaboratory Studies (iis) in Spijkenisse, The Netherlands, was the organiser of this proficiency test. Analysis for fit-for-use and homogeneity testing were subcontracted. It was decided to send two different samples of used oils: one sample of 1 litre used H576 Hydraulic Fluid and one sample of 0.1 litre used H515 Hydraulic Fluid especially for wear metals. Participants were requested to report rounded and unrounded results. The unrounded results were preferably used for statistical evaluation.

2.1 QUALITY SYSTEM

The Institute for Interlaboratory Studies in Spijkenisse, the Netherlands, has implemented a quality system on ISO guide 43, ILAC-G13:2007 and ISO17043:2010. This ensures strict adherence to protocols for sample preparation and statistical evaluation and 100% confidentiality of participant's data. Feedback from the participants on the reported data is encouraged and customer's satisfaction is measured on regular basis by sending out questionnaires.

2.2 PROTOCOL

The protocol followed in the organisation of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' of January 2010 (iis-protocol, version 3.2).

2.3 CONFIDENTIALITY STATEMENT

All data present in this report must be regarded as confidential and for use by the participating companies only. Disclosure of the information in this report is only allowed by means of the entire report. Use of the contents of this report for third parties is only allowed by written permission of the Institute for Interlaboratory Studies. Disclosure of the identity of one or more of the participating companies will be done only after receipt of a written agreement of the companies involved.

2.4 SAMPLES

The necessary bulk materials for the two samples of used Hydraulic Fluid were obtained from a participating laboratory. The approximately 45 litre of the first bulk material was homogenised in

a precleaned drum. After homogenisation, 43 subsamples were transferred to 1 litre amber glass bottles, and labelled #11102. The homogeneity of the subsamples #11102 was checked by determination of Density in accordance with ASTM D4052:09 and Water according to ASTM D6304:07 on 8 stratified randomly selected samples.

	<i>Density @ 15 °C in kg/L</i>	<i>Water in %M/M</i>
Sample #11102-1	0.87084	0.0107
Sample #11102-2	0.87084	0.0112
Sample #11102-3	0.87087	0.0111
Sample #11102-4	0.87087	0.0111
Sample #11102-5	0.87087	0.0111
Sample #11102-6	0.87087	0.0109
Sample #11102-7	0.87085	0.0110
Sample #11102-8	0.87087	0.0111

table 1: homogeneity test results of subsamples #11102

From the test results of table 1, the repeatabilities were calculated and compared with 0.3 times the corresponding target reproducibility in agreement with the procedure of ISO 13528, Annex B2 in the next table:

	<i>Density @ 15 °C in kg/L</i>	<i>Water in %M/M</i>
r (Observed)	0.00004	0.0004
reference method	D4052:09	D6304:07
0.3 * R (ref. method)	0.00015	0.0085

table 2: repeatabilities of subsamples #11102

The approximately 5 litre of the second bulk material, positive on wear metals, was homogenised and was transferred to 40 subsamples of 100 mL HDPE containers, labelled #11103. The homogeneity of the subsamples #11103 was checked by determination of Phosphorus in accordance with ASTM D5185:09 on 8 stratified randomly selected samples.

	<i>Phosphorus in mg/kg</i>
Sample #11103-1	434
Sample #11103-2	437
Sample #11103-3	437
Sample #11103-4	439
Sample #11103-5	434
Sample #11103-6	428
Sample #11103-7	432
Sample #11103-8	428

table 3: homogeneity test results of subsamples #11103

From the test results of table 3, the repeatability was calculated and compared with 0.3 times the corresponding target reproducibility in agreement with the procedure of ISO 13528, Annex B2 in the next table:

	<i>Phosphorus in mg/kg</i>
r (Observed)	11.5
reference method	D5185:09
0.3* R (ref. method)	26.9

table 4: repeatability of subsamples #11103

Each calculated repeatability was equal or less than 0.3 times the corresponding reproducibility of the respective test method. Therefore, homogeneity of the subsamples #11102 and #11103 was assumed.

To each of the participating laboratories was dispatched: One 1 litre amber glass bottle, labelled #11102 and one 100 mL HDPE container, labelled #11103 on October 26, 2011.

2.5 STABILITY OF THE SAMPLES

The stability of Hydraulic Fluid, packed in the brown glass bottles or in HDPE containers, was checked. The material was found sufficiently stable for the period of the proficiency test.

2.6 ANALYSES

The participants were asked to determine Total Acid Number, Density @ 15°C, Flash Point PMcc, Kinematic Viscosity @ 40°C and @ 100°C, Extractable Organic Halogens, Total Organic Halogens and Water on sample #11102 and 20 elements (17 wear metals and 3 additives) on sample #11103.

To get comparable results a detailed report form, on which the units were prescribed, was sent together with each set of samples. In addition, a letter of instructions and a SDS were added to the package.

3 RESULTS

During four weeks after sample despatch, the results of the individual laboratories were gathered. The original results are tabulated per determination in the appendix 1 of this report. The laboratories are presented by their code numbers.

Directly after the deadline the available results were screened for suspect data. A result was called suspect in case the Huber Elimination Rule (a robust outlier test) found it to be an outlier. The laboratories that produced these suspect data were asked to check the results. Additional or corrected data are put under 'Remarks' in the result tables in appendix 1.

Results that came in after deadline were not taken into account in the screening for suspect data and thus these participants were not requested for checks.

3.1 STATISTICS

The protocol followed in the organisation of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' of January 2010 (iis-protocol, version 3.2).

For the statistical evaluation the *unrounded* (when available) figures were used instead of the rounded results. Results reported as '<...' or '>...' were not used in the statistical evaluation.

First, the normality of the distribution of the various data sets per determination was checked by means of the Lilliefors-test. After removal of outliers, this check was repeated. In case a data set does not have a normal distribution, the results of the statistical evaluation should be used with due care.

In accordance with ISO 5725 (1986 and 1994) the original results per determination were submitted subsequently to Dixon and Grubbs outlier tests. Outliers are marked by D(0.01) for the Dixon test and by G(0.01) or DG(0.01) for the Grubbs test. Stragglers are marked by D(0.05) for the Dixon test and by G(0.05) or DG(0.05) for the Grubbs test. Both outliers and stragglers were not included in the calculations of the averages and the standard deviations.

For each assigned value the uncertainty was determined in accordance with ISO13528.

Subsequently the calculated uncertainty was evaluated against the respective requirement based on the target reproducibility in accordance with ISO13528. When the uncertainty passed the evaluation no remarks are made in the report. However, when the uncertainty failed the evaluation it is mentioned in the report and it will have consequences for the evaluation of the test results.

Finally, the reproducibilities were calculated from the standard deviations by multiplying these with a factor of 2.8.

3.2 GRAPHICS

In order to visualize the data against the reproducibilities from literature, Gauss plots were made, using the sorted data for one determination (see appendix 1). On the Y-axis the reported analysis results are plotted. The corresponding laboratory numbers are under the X-axis. The straight horizontal line presents the consensus value (a trimmed mean). The four striped lines, parallel to the consensus value line, are the +3s, +2s, -2s and -3s target reproducibility limits of the selected standard. Outliers and other data, which were excluded from the calculations, are represented as a cross. Accepted data are represented as a triangle.

Furthermore, Kernel Density Graphs were made. This is a method for producing a smooth density approximation to a set of data that avoids some problems associated with histograms (see appendix 3, nr.13-14).

3.3 Z-SCORES

To evaluate the performance of the participating laboratories the z-scores were calculated. As it was decided to evaluate the performance of the participants in this proficiency test (PT) against the literature requirements, e.g. ASTM reproducibilities, the z-scores were calculated using a target standard deviation. This results in an evaluation independent of the spread of this interlaboratory study.

The target standard deviation was calculated from the target reproducibility (preferably taken from a standardized test method) by division with 2.8.

The z-scores were calculated in accordance with:

$$z_{(\text{target})} = (\text{result} - \text{average of PT}) / \text{target standard deviation}$$

The $z_{(\text{target})}$ scores are listed in the result tables in appendix 1.

When a laboratory did use a test method with a reproducibility that is significantly different from the reproducibility of the reference test method used in this report, it is strongly advised to recalculate the z-score, while using the reproducibility of the actual test method used, this in order to evaluate the fit-for-useness of the reported test result.

Absolute values for $z < 2$ are very common and absolute values for $z > 3$ are very rare. The usual interpretation of z-scores is as follows:

$ z < 1$	good
$1 < z < 2$	satisfactory
$2 < z < 3$	questionable
$3 < z $	unsatisfactory

4 EVALUATION

In this proficiency test, no serious problems were encountered during dispatch and execution. Only one laboratory received the samples late. Two laboratories reported the results after the final reporting date and two other laboratories did not report any results at all.

The 36 reporting participants sent in 667 numerical results. Observed were 65 outlying results, which is 9.7% of the numerical results. In proficiency studies, outlier percentages of 3% - 7.5% are quite normal.

Not all original data sets proved to have a normal distribution. An abnormal distribution was found for the following determination: Acid Number, Density, Aluminium, Lead, Magnesium, Sodium, Silicon and Tin. In this case the statistical evaluation should be used with due care.

4.1 EVALUATION PER TEST

In this section, the results are discussed per test. The methods that are used by the various laboratories are taken into account for explaining the observed differences when possible and applicable. These methods are also in the tables together with the original data. The abbreviations, used in these tables, are listed in appendix 3.

One should be ware that the sample “metals only” (#11103) contained a large number of elements, spectral interferences might explain the large spread found for some elements.

Acid Number (Total): This determination was very problematic. Only one statistical outlier was observed. However, the calculated reproducibility after rejection of the statistical outlier is not at all in agreement with the requirements of ASTM D664:11a (or ASTM D974:11). *The large spread may be explained by the difference in volume found by using inflection-point titration or by end-point titration (see ASTM D664:11a, fig.1 and 13.1.2).*

Density @ 15°C: This determination was problematic for a number of laboratories. Seven statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in full agreement with the requirements of ASTM D4052:09.

Flash Point PMcc: This determination was not problematic. Only one statistical outlier was observed and the calculated reproducibility after rejection of the statistical outlier is in full agreement with the requirements of ASTM D93:11 method B.

Kin.Visco.@ 40°C: This determination was very problematic. Five statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is not at all in agreement with the requirements of ASTM D445:11a.

Kin.Visco.@ 100°C: This determination was very problematic. Three statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is not at all in agreement with the requirements of ASTM D445:11a.

Extractable Organic Halogens: For this determination, only one numerical result was reported. Therefore no significant conclusions were drawn.

Water: This determination was not problematic. Three statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with the requirements of ASTM D6304:07. The preferred method to use is ASTM D6304:07 method C. This method is applicable for oils with difficult matrix interferences (presence of additives).

Aluminium: This determination was not problematic. Only two statistical outliers were observed and the calculated reproducibility after rejection of the statistical outliers is in agreement with the requirements of ASTM D5185:09.

Barium: As the average concentration found by the group (29.7 mg/kg) is above the application range given in ASTM D5185:09 table 3 (0.5 – 4 mg/kg), it was decided to use the estimated reproducibility calculated using the Horwitz equation instead of the reproducibility of ASTM D5185:09. This determination may not be problematic. Only one statistical outlier was observed and the calculated reproducibility after rejection of the statistical outlier is in good agreement with the estimated requirements calculated using the Horwitz equation.

Chromium: This determination was not problematic. Only two statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is in good agreement with the requirements of ASTM D5185:09.

Copper: This determination was not problematic. Only one statistical outlier was observed and the calculated reproducibility after rejection of the statistical outlier is in good agreement with the requirements of ASTM D5185:09.

Iron: This determination was not problematic. One statistical outlier was observed and the calculated reproducibility after rejection of the statistical outlier is in full agreement with the requirements of ASTM D5185:09.

Lead: This determination was not problematic at this low level (6.3 mg/kg). Although the consensus value found is below the application range of the test method, no statistical outliers were observed and the calculated reproducibility is in full agreement with the requirements of ASTM D5185:09.

Lithium: This determination was not problematic. No statistical outliers were observed and the calculated reproducibility is in agreement with the estimated requirements, calculated using the Horwitz equation.

Magnesium: This determination was not problematic. Two statistical outliers were detected. The calculated reproducibility after rejection of the statistical outliers is in full agreement with the requirements of ASTM D5185:09.

Manganese: This determination was problematic. Two statistical outliers were detected and the calculated reproducibility after rejection of the statistical outliers is not in agreement with the requirements of ASTM D5185:09.

Molybdenum This determination was problematic for a number of laboratories. Three statistical outliers were observed. However, the calculated reproducibility

after rejection of the statistical outliers is in good agreement with the requirements of ASTM D5185:09

- Nickel: This determination was not problematic. Five statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in agreement with the requirements of ASTM D5185:09.
- Sodium: This determination was very problematic. Two statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is not at all in agreement with the requirements of ASTM D5185:09.
- Silicon: This determination was not problematic at this low level (7.2 mg/kg). Although the consensus value found is below the application range of the test method, one false negative and three statistical outliers were observed. However, the calculated reproducibility is in good agreement with the requirements of ASTM D5185:09.
- Silver: This determination was problematic for a number of laboratories. Five statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in agreement with the requirements of ASTM D5185:09.
- Tin: This determination was not problematic at this low level (6.0 mg/kg). Although the consensus value found is below the application range of the test method, three statistical outliers were observed. However, the calculated reproducibility is in good agreement with the requirements of ASTM D5185:09.
- Titanium: This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with the requirements of ASTM D5185:09.
- Vanadium: This determination was problematic for a number of laboratories. Three statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outlier was almost in agreement with the requirements of ASTM D5185:09.
- Calcium: As the average concentration found by the group (23.5 mg/kg) is below the application range given in ASTM D5185:09 table 3 (40-9000 mg/kg), it was decided to use the estimated reproducibility calculated using the Horwitz equation instead of the reproducibility of ASTM D5185:09. This determination was problematic for a number of laboratories. Three statistical outliers were observed. However, the calculated reproducibility

after rejection of the statistical outliers is in agreement with the estimated requirements, calculated using the Horwitz equation.

Phosphorus: This determination was problematic. Only one statistical outlier was observed. However, the calculated reproducibility after rejection of the statistical outlier is not in agreement with the requirements of ASTM D5185:09.

Zinc: As the average concentration found by the group (29.4 mg/kg) is below the application range given in ASTM D5185:09 table 3 (60-1600 mg/kg), it was decided to use the estimated reproducibility calculated using the Horwitz equation instead of the reproducibility of ASTM D5185:09. This determination was not problematic. Two statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is in full agreement with the estimated requirements, calculated using the Horwitz equation.

4.2 PERFORMANCE EVALUATION FOR THE GROUP OF LABORATORIES

A comparison has been made between the reproducibility as declared by the relevant standard and these parameters as found for the group of participating laboratories. The average results and the calculated reproducibilities are compared in the next tables with the reproducibilities, derived from literature standards (in casu the ASTM, IP, ISO and EN standards, see tables in appendix 1).

Parameter	Unit	n	Average	2.8 * sd	R(lit)
Total Acid Number	mg KOH/g	29	0.103	0.111	0.045
Density @ 15 °C	kg/L	23	0.8709	0.0005	0.0005
Flash Point PMcc	°C	28	199.95	9.91	10.00
Kinematic viscosity @ 40 °C	mm/s ²	31	30.489	0.447	0.232
Kinematic viscosity @ 100 °C	mm/s ²	30	5.3214	0.1078	0.0404
Organic Halogens Extractable	mg/kg	1	n.a.	n.a.	n.a.
Water	%M/M	25	0.0091	0.0095	0.0253

table 5: reproducibilities of results of sample #11102.

Parameter	Unit	n	average	2.8 * sd	R (lit)
Aluminium as Al	mg/kg	26	5.55	4.21	5.93
Barium as Ba	mg/kg	21	29.69	6.89	(7.99)
Chromium as Cr	mg/kg	25	5.75	1.86	2.35
Copper as Cu	mg/kg	27	22.64	4.76	5.43
Iron as Fe	mg/kg	26	24.94	6.93	6.82
Lead as Pb	mg/kg	26	6.26	6.08	(5.81)
Lithium as Li	mg/kg	9	31.45	7.49	8.38
Magnesium as Mg	mg/kg	23	5.71	2.67	2.75
Manganese as Mn	mg/kg	19	5.81	1.82	1.07
Molybdenum as Mo	mg/kg	18	5.41	1.96	2.12
Nickel as Ni	mg/kg	21	5.84	2.06	3.62
Silicon as Si	mg/kg	20	7.16	4.18	(6.25)
Silver as Ag	mg/kg	15	3.51	1.33	1.32
Sodium as Na	mg/kg	20	7.41	7.97	4.56
Tin as Sn	mg/kg	18	5.97	3.38	(6.36)
Titanium as Ti	mg/kg	18	5.68	1.37	5.66
Vanadium as V	mg/kg	20	5.72	2.16	1.91
Calcium as Ca	mg/kg	26	23.49	7.15	(6.54)
Phosphorus as P	mg/kg	24	446.42	102.78	90.85
Zinc as Zn	mg/kg	27	29.36	7.92	(7.91)

table 6: reproducibilities of results of sample #11103

results between brackets to be used with care, result was lower (or above) than application range of reference method

Without further statistical calculations, it could be concluded that for many tests there is a good compliance of the group of participating laboratories with the relevant standards. The problematic tests have been discussed in paragraph 4.1.

4.3 COMPARISON OF THE PROFICIENCY TEST OF NOVEMBER 2011 WITH THE PREVIOUS PTs.

	November 2011	November 2010	November 2009	November 2008
Number of reporting labs	36	30	30	25
Number of results reported	667	434	520	418
Statistical outliers	65	36	35	32
Percentage outliers	9.7%	8.3%	6.7%	7.7%

table 7: comparison with previous proficiency tests.

In proficiency tests, outlier percentages of 3% - 7.5% are quite normal.

The performance of the determinations of the proficiency tests was compared against the requirements of the respective standards. The conclusions are given the following table:

Determination	November 2011	November 2010	November 2009	November 2008
Total Acid Number	--	+	++	++
Density @ 15 °C	+/-	--	--	--
Flash Point PMcc	+/-	++	--	--
Kinematic viscosity @ 40 °C	--	--	--	--
Kinematic viscosity @ 100 °C	--	--	--	--
