## **1 INTRODUCTION**

Since 1999, the Institute for Interlaboratory Studies organizes proficiency tests for the analysis of Benzene and Toluene. In the annual proficiency testing program of 2011-2012, it was decided to continue the proficiency test for the analysis of Benzene and Toluene. In the interlaboratory study for Benzene 48 laboratories from 22 different countries have participated and for Toluene 43 participants in 20 countries have participated. See appendix 2 for the number of participants per country.

In this report, the results of the proficiency test Benzene and Toluene are presented and discussed.

## **2 SET UP**

The Institute for Interlaboratory Studies (iis) in Spijkenisse, the Netherlands, was the organizer of this proficiency test. The analyses for fit-for-use and homogeneity determination were subcontracted to an accredited laboratory. The participants received depending on their registration: 1\* 1 litre bottle with Benzene (sample #12051) and/or 1\* 1 litre bottle with Toluene (sample #12052).

In order to collect sufficient data for a statistical evaluation, the participants were asked to send in rounded and unrounded results. The unrounded were preferred used for statistical evaluation.

### **2.1 ACCREDITATION**

The Institute for Interlaboratory Studies in Spijkenisse, the Netherlands, is accredited in accordance with ISO guide 43 and ILAC-G13:2007, (R007), since January 2000, by the Dutch Accreditation Council (Raad voor Accreditatie), see [www.rva.nl](http://www.rva.nl). This ensures 100% confidentiality of participant's data. Also, customer's satisfaction is measured on a regular basis by sending out questionnaires. The analysis did subcontract to an accredited laboratory.

### **2.2 PROTOCOL**

The protocol followed in the organisation of this proficiency test was the one as described for proficiency testing in the report 'iis. Interlaboratory Studies: Protocol for the Organization, Statistics and Evaluation' (iis-protocol, version 3.2) of January 2010.

### **2.3 CONFIDENTIALITY STATEMENT**

All data presented in this report must be regarded as confidential and for use by the participating companies only. Disclosure of the information in this report is only allowed by means of the entire report. Use of the contents of this report for third parties is only allowed by written permission of the Institute for Interlaboratory Studies. Disclosure of the identity of

one or more of the participating companies will be done only after receipt of a written agreement of the companies involved.

## 2.4 SAMPLES

### BENZENE

The necessary bulk material of Benzene was obtained from a local chemical supplier. The approximately 74 litre was spiked with 506.6 mg 1-Methyl-2-Pyrrolidinone (for the Nitrogen determination) and 373.6 mg o-Chlorotoluene (for the Organic Chlorine determination). The bulk sample was, after homogenisation, divided over 74 amber glass bottles of 1 litre, labelled #12051. The homogeneity of the subsamples #12051 was checked by determination of Organic Chlorine in accordance with ASTM D5808:09a, Density @ 20°C in accordance with ASTM D4052:11 and Toluene content according to ASTM D4492:10, on 8 stratified randomly selected samples.

Benzene	Organic Chlorine in mg/kg	Density at 20°C in kg/L	Toluene in mg/kg
sample #12051-1	1.3	0.87897	370
sample #12051-2	1.2	0.87898	363
sample #12051-3	1.3	0.87900	358
sample #12051-4	1.3	0.87900	360
sample #12051-5	1.3	0.87900	370
sample #12051-6	1.4	0.87901	385
sample #12051-7	1.3	0.87900	359
sample #12051-8	1.3	0.87898	346

table 1: homogeneity test results of Benzene sub samples #12051

From the above test results the repeatabilities were calculated and compared with 0.3 times the corresponding reproducibilities of the target methods, in agreement with the procedure of ISO 13528, Annex B2 in the next table;

	Organic Chlorine in mg/kg	Density at 20°C in kg/L	Toluene in mg/kg
r (sample #12051)	0.3	0.00004	32
target	ASTM D5808:09a	ASTM D4052:11	ASTM D4492:10
0.3*R (target)	0.4	0.00015	51

table 2: evaluation of repeatabilities of subsamples #12051

The calculated repeatabilities were in agreement with 0.3 times the corresponding target reproducibility. Therefore, homogeneity of the samples was assumed.

### TOLUENE

The necessary bulk material of Toluene was purchased from a local chemical supplier. The approximately 60 litre was, after homogenisation, divided over 60 brown glass bottles of 1 litre, labelled #12052. The homogeneity of the subsamples #12052 was checked by determination of Purity, according to ASTM D2360:11 and Density @ 20°C according to ASTM D4052:11 on 8 stratified randomly selected samples.

Toluene	Purity in %M/M	Density at 20°C in kg/L
sample #12052-1	99.96	0.86684
sample #12052-2	99.96	0.86683
sample #12052-3	99.96	0.86684
sample #12052-4	99.95	0.86684
sample #12052-5	99.96	0.86684
sample #12052-6	99.96	0.86684
sample #12052-7	99.96	0.86686
sample #12052-8	96.96	0.86686

table 3: homogeneity test results of Toluene sub samples #12052

From the above test results the repeatabilities were calculated and compared with 0.3 times the corresponding reproducibilities of the target methods, in agreement with the procedure of ISO 13528, Annex B2 in the next table;

	Purity in %M/M	Density at 20°C in kg/L
r (sample #12052)	0.004	0.00003
target	ASTM 4492:10	ASTM D4052:11
0.3*R (target)	0.006	0.00015

table 4: evaluation of repeatabilities of subsamples #12052

The calculated repeatabilities were in agreement with 0.3 times the corresponding target reproducibility. Therefore, homogeneity of the samples was assumed.

Depending on their registration to each of the participating laboratories one 1 litre bottle of Benzene labelled #12051 and/or one 1 litre bottle of Toluene labelled #12052 were sent on April 4, 2012.

## 2.5 STABILITY OF THE SAMPLES

The stability of Benzene and Toluene, packed in an amber glass bottles, was checked. The material was found sufficiently stable for the period of the proficiency test.

## 2.6 ANALYSES

The participants were requested to determine on the Benzene sample #12051: Acid Wash Color, Acidity, Appearance, Bromine Index, Color Pt-Co, Density @ 20°C, Distillation, Organic Chlorides, Total Chlorides, Total Nitrogen, Solidification Point, Methylcyclohexane, Toluene, Nonaromatics and Purity.

On Toluene sample #12052 were requested: Acid Wash Color, Appearance, Copper Corrosion, Color Pt-Co, Density @ 20°C, Distillation, Purity, Nonaromatics, Benzene and Styrene.

To get maximum information for the statistical calculations, the participants were requested to report unrounded results and results below the usual lower reporting limits, where

possible. To get comparable results a detailed report form, on which the units were prescribed, was sent together with each set of samples. Also, a letter of instructions and a SDS was added to the package.

### 3 RESULTS

During four weeks after sample despatch, the results of the individual laboratories were received. The original reported results are tabulated per determination in appendix 1 of this report. The laboratories are presented by their code numbers.

Directly after the deadline, a reminder fax was sent to those laboratories that had not yet reported any results at that moment.

Shortly after the deadline, the available results were screened for suspect data. A result was called suspect in case the Huber Elimination Rule (a robust outlier test) found it to be an outlier. The laboratories that produced these suspect data were asked to check the results. Additional or corrected results are used for data analysis and original results are placed under 'Remarks' in the result tables in appendix 1.

#### 3.1 STATISTICS

Statistical calculations were performed as described in the report 'iis Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' (iis-protocol, version 3.2) of January 2010.

For statistical evaluation the *unrounded* (when available) figures were used instead of the rounded results. Results reported as '<...' or '>...' were not used in the statistical evaluation.

First, the normality of the distribution of the various data sets per determination was checked by means of the Lilliefors-test. After removal of outliers this check was repeated. Not all data sets proved to have a normal distribution, in which cases the results of the statistical evaluation should be used with due care.

In accordance to ISO 5725 (1986 and 1994) the original results per determination were subsequently submitted to Dixon and Grubbs outlier tests. Outliers are marked by D(0.01) for the Dixon test and by G(0.01) or DG(0.01) for the Grubbs test. Stragglers are marked by D(0.05) for the Dixon test and by G(0.05) or DG(0.05) for the Grubbs test. Both outliers and stragglers were not included in the calculations of the averages and the standard deviations.

For each assigned value the uncertainty was determined in accordance with ISO13528. Subsequently the calculated uncertainty was evaluated against the respective requirement based on the target reproducibility in accordance with ISO13528. When the uncertainty passed the evaluation no remarks are made in the report. However, when the uncertainty failed the evaluation it is mentioned in the report and it will have consequences for the evaluation of the test results.

Finally, the reproducibilities were calculated from the standard deviations by multiplying these with a factor of 2.8.

### 3.2 GRAPHICS

In order to visualise the data against the reproducibilities from literature, Gauss plots were made, using the sorted data for one determination (see appendix 1). On the Y-axis the reported analysis results are plotted. The corresponding laboratory numbers are under the X-axis.

The straight horizontal line presents the consensus value (a trimmed mean). The four striped lines, parallel to the consensus value line, are the +3s, +2s, -2s and -3s target reproducibility limits of the selected standard. Outliers and other data, which were excluded from the calculations, are represented as a cross. Accepted data are represented as a triangle. Furthermore, Kernel Density Graphs were made. This method is for producing a smooth density approximation to a set of data that avoids some problems associated with histograms (see appendix 3; nr.14 and 15).

### 3.3 Z-SCORES

To evaluate the performance of the participating laboratories the z-scores were calculated. As it was decided to evaluate the performance of the participants in this proficiency test (PT) against the literature requirements, e.g. ASTM reproducibilities, the z-scores were calculated using a target standard deviation. This target standard deviation was calculated from the literature reproducibility by division with 2.8.

When a laboratory did use a test method with a reproducibility that is significantly different from the reproducibility of the reference test method used in this report, it is strongly advised to recalculate the z-score, while using the reproducibility of the actual test method used, this in order to evaluate the fit-for-useness of the reported test result.

The z-scores were calculated according to:

$$z_{(\text{target})} = (\text{result} - \text{average of PT}) / \text{target standard deviation}$$

Absolute values for  $z < 2$  are very common and absolute values for  $z > 3$  are very rare. Therefore, the usual interpretation of z-scores is as follows:

$ z  < 1$	good
$1 <  z  < 2$	satisfactory
$2 <  z  < 3$	questionable
$3 <  z $	unsatisfactory

## 4 EVALUATION

In this proficiency test, problems were encountered during the execution. Laboratories in Brazil and Saudi Arabia did receive the samples late due to courier problems and/or custom clearance. For #12051 (Benzene) and #12052 (Toluene) respectively three and four participants reported test results after the final reporting date.

Not all laboratories were able to perform all analysis requested. Finally, for sample #12051 (Benzene) and sample #12052 (Toluene) in total 718 results were submitted. Observed were in total 27 outlying results, which is 3.8%. In proficiency studies, outlier percentages of 3% - 7.5% are normal.

### 4.1 EVALUATION PER SAMPLE AND TEST

In this section, the results are discussed per sample and test. The methods, which are used by the various laboratories, were taken into account for explaining the observed differences when possible and applicable. These methods are also in the tables together with the original data. The abbreviations, used in these tables, are listed in appendix 3. In case no suitable test method is available, the Horwitz equation was used.

Not all original data sets proved to have a normal distribution. Not normal distributions were found for sample #12051: Color Pt-Co, Density, Distillation (IBP, 50% and DP), Organic Chloride, Solidification Point and Purity. For sample #12052 not normal distributions were found for: Color Pt-Co, Density, Distillation (IBP, 50% and DP), Non aromatics and Benzene. For these determinations the results of the statistical evaluation should be used with due care.

#### For Benzene sample #12051

Acid Wash Color: No analytical problems were observed. Twenty-four laboratories reported the Acid Wash Color as 1-. Other laboratories reported the Acid Wash Color as 0, 0+ or '0-1'.

Acidity: This determination was not problematic. The way of reporting varies strongly and should be improved in accordance with ASTM D847:08: report "no free acid" (NFA) or, when positive, "acidity as mg NaOH/100 mL".

Appearance: No analytical problems were observed. All labs agreed about the appearance of the sample #12051, which was bright, clear and free of suspended matter.

Bromine Index: This determination was not problematic. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is in good agreement with the estimated reproducibility requirements of ASTM D5776:07e1.

Color Pt-Co: This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the

statistical outliers is in good agreement with the requirements of ASTM D1209:05e1.

Density @20°C: This determination was not problematic. Two statistical outliers were observed. The calculated reproducibility after rejection of the statistical outlier is in good agreement with the requirements of ASTM D4052:11.

Distillation: This determination was problematic for two laboratories. In total six statistical outliers were observed. The calculated reproducibilities for IBP 50% recovered and DP, after rejection of statistical outliers, are all in agreement with the requirements of ASTM D850:08e1. From the reported results of the 50% recovered, it appears that four participants obviously did not correct the results for barometric pressure and thermometer inaccuracy as described in ASTM D850-08e1 (paragraph 11.4).

Organic Chloride: This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with the requirements of ASTM D5808:09a. The average concentration is in good agreement with the average concentration of total chloride and with the spiked amount of chlorotoluene.

Total Chloride: This determination may be problematic. No statistical outliers were observed. However, the calculated reproducibility is almost in agreement with the requirements of ASTM D5194:11. The average concentration is in good agreement with the average concentration of organic chloride. One participant used standard IP510. Using this standard organic halogens are determined, but not total chloride and with the spiked amount of chlorotoluene.

Total Nitrogen: This determination may be problematic. No statistical outliers were observed. However, the calculated reproducibility is almost in agreement with the requirements of ASTM D6069:06. The average recovery of Total Nitrogen (theoretical increment of 1.10 mg/kg) has to be reported as “less than 109%”. This due to the fact that the actual blank Total Nitrogen is unknown.

Solidification Point: This determination was problematic. No statistical outliers were observed. However, the calculated reproducibility is not in agreement with the requirements of ASTM D852:08. Important in this solidification point determination is addition of water, the correct benzene container and the correction by 0.09°C.

Methylcyclohexane: The concentration of methylcyclohexane was near or below the detection limit of the method used and most of the participants reported a less than result. Therefore no statistical conclusions were drawn.

Toluene: This determination was not problematic. Only one statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is in good agreement with the reproducibility of ASTM D4492:10.

Nonaromatics: This determination was very problematic. Two statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers, is not at all in agreement with the reproducibility of ASTM D4492:10. The large spread is probably (partly) caused by low concentration of nonaromatics (16 mg/kg).

Purity: This determination was not problematic. Three statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers, is in good agreement with the estimated reproducibility of ASTM D4492:10.

### **For Toluene sample #12052**

Acid Wash Color: No analytical problems were observed. Eighteen laboratories reported the Acid Wash Color as 1-. Other laboratories reported the Acid Wash Color as 0, 0+, '0-1', 2 or 3.

Appearance: No analytical problems were observed. All labs agreed about the appearance of the sample #12052, which was bright, clear and free of suspended matter. The uniformity of reporting can be improved.

Copper Corr: No problems have been observed. The majority of the participants agreed on a result of 1 (1A). Three participants reported the Copper Corrosion as pass.

Color Pt-Co: This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with the requirements of ASTM D1209:05e1.

Density @20°C: This determination was not problematic. Three statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with the requirements of ASTM D4052:11.

Distillation: This determination was problematic for a one laboratory. In total two statistical outliers were observed. The calculated reproducibilities, after rejection of statistical outliers, are all in agreement with the requirements of ASTM D850:08e1. From the reported results of the 50% recovered, it appears that one participant obviously did not correct the results for barometric pressure and thermometer inaccuracy as described in ASTM D850-08e1 (paragraph 11.4).

- Purity: This determination was not problematic. Only one statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is in good agreement with the requirements of ASTM D2360:11.
- Nonaromatics: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in good agreement with the requirements of ASTM D2360:11.
- Benzene: This determination may be very problematic. Only one statistical outlier was observed. However, the calculated reproducibility is not at all in agreement with the strict estimated reproducibility limits calculated using the Horwitz equation.
- Styrene: The concentration of styrene was or near of below the detection limit of the method used and most of the participants reported a less than result. Therefore no statistical conclusions were drawn.

#### 4.2 PERFORMANCE EVALUATION FOR THE GROUP OF LABORATORIES

A comparison has been made between the reproducibility as declared by the relevant standard and the reproducibility as found for the group of participating laboratories. The average results per sample, calculated reproducibilities and reproducibilities derived from literature standards (in casu ASTM standards) are compared in the next table.

Parameter	unit	n	average	2.8 *sd <sub>R</sub>	R (lit)
Acid Wash Color		34	1-	n.a.	n.a.
Acidity	mgNaOH/100ml	33	no free acid	n.a.	n.a.
Appearance		36	pass	n.a.	n.a.
Bromine Index	mg Br/100g	14	1.70	3.03	4.60
Color Pt-Co		24	2.7	3.5	7.0
Density @ 20°C	kg/l	40	0.8790	0.0002	0.0005
Distillation, IBP	°C	33	79.81	0.29	0.42
Distillation, 50%	°C	33	80.09	0.18	0.42
Distillation, DP	°C	33	80.35	0.36	0.42
Organic Chloride	mg/kg	13	1.44	0.32	1.30
Total Chloride	mg/kg	8	1.46	1.04	0.90
Total Nitrogen	mg/kg	20	1.20	0.52	0.46
Solidification Point	°C	27	5.47	0.07	0.05
Methylcyclohexane	mg/kg	25	<10	n.a.	n.a.
Toluene	mg/kg	36	369.4	50.9	172.0
Nonaromatics	mg/kg	26	16.4	13.4	4.1
Purity	%M/M	35	99.961	0.005	0.027

Table 5: reproducibilities of Benzene sample #12051

Parameter	unit	n	average	$2.8 * s_{dR}$	R (lit)
Acid Wash Color		33	1-	n.a.	n.a.
Appearance		34	pass	n.a.	n.a.
Copper corrosion		30	1(1A)	n.a.	n.a.
Color Pt-Co		22	3.7	4.7	7.0
Density @ 20°C	kg/L	36	0.8669	0.0002	0.0005
Distillation, IBP	°C	34	110.32	0.27	0.58
Distillation, 50% rec.	°C	33	110.60	0.10	0.16
Distillation, DP	°C	33	110.70	0.23	0.46
Purity	%M/M	32	99.959	0.014	0.021
Nonaromatics	mg/kg	31	365.6	105.1	174.8
Benzene	mg/kg	32	15.0	8.7	4.5
Styrene	mg/kg	26	<10	n.a.	n.a.

Table 6: reproducibilities of Toluene sample #12052

Without further statistical calculations, it can be concluded that for most of the tests there is a compliance of the group of participating laboratories with the relevant standards. The tests that are problematic have been discussed in paragraph 4.1.

#### 4.3 COMPARISON OF THE PROFICIENCY TEST OF APRIL 2012 WITH PREVIOUS PTS

	April 2012	April 2011	April 2010	April 2009
Number of reporting labs	46	45	44	42
Number of results reported	718	833	684	811
Statistical outliers	27	45	28	28
Percentage outliers	3.8%	5.4%	4.1%	3.5%

table 7: comparison with previous proficiency tests.

In proficiency tests, outlier percentages of 3% - 7.5% are quite normal.

The performance of the determinations of the proficiency tests was compared against the requirements of the respective standards. The conclusions are given the following table:

	April 2012	April 2011	April 2010	April 2009
Acid Wash Color	n.e.	++	++	++
Acidity	n.e.	++	n.e.	++
Appearance	n.e.	++	n.e.	++
Bromine Index	++	++	++	+/-
Color Pt-Co	++	++	++	++
Density @ 20°C	++	++	++	++
Distillation, IBP	++	++	++	+

Density @ 20 °C	++	++	++	++
Distillation, IBP	++	++	++	++
Distillation, 50%	++	++	++	--
Distillation, DP	++	++	++	++
Purity	++	--	++	++
Nonaromatics	++	++	++	++
Benzene	-- *)	-- *)	- *)	-- *)
Styrene	n.e.	++ *)	+ *)	+/- *)

table 9: comparison determinations on Toluene against the standard

\*) against the strict Horwitz equation

The performance of the determinations against the requirements of the respective standards is listed in the above table. The following performance categories were used:

- ++: group performed much better than the standard
- + : group performed better than the standard
- +/-: group performance equals the standard
- : group performed worse than the standard
- : group performed much worse than the standard
- n.e.: not evaluated

## APPENDIX 2

### Number of participants in the Benzene PT

1 lab in AUSTRIA  
2 labs in BELGIUM  
3 labs in BRAZIL  
1 lab in CANADA  
2 labs in FRANCE  
3 labs in GERMANY  
3 labs in INDIA  
1 lab in ISRAEL  
1 lab in KOREA  
2 labs in KUWAIT  
1 lab in MALAYSIA  
8 labs in P.R. of CHINA  
1 lab in POLAND  
1 lab in ROMANIA  
4 labs in SAUDI ARABIA  
1 lab in SPAIN  
1 lab in THAILAND  
4 labs in THE NETHERLANDS  
1 lab in TURKEY  
1 lab in U.A.E.  
4 labs in U.S.A.  
2 labs in UNITED KINGDOM

### Number of participants in the Toluene PT

1 lab in BELGIUM  
3 labs in BRAZIL  
1 lab in CANADA  
2 labs in FRANCE  
4 labs in GERMANY  
3 labs in INDIA  
1 lab in IRAN  
1 lab in ISRAEL  
1 lab in ITALY  
9 labs in P.R. of CHINA  
1 lab in POLAND  
1 lab in PORTUGAL  
1 lab in ROMANIA  
1 lab in SAUDI ARABIA  
1 lab in SPAIN  
4 labs in THE NETHERLANDS  
1 lab in TURKEY  
4 labs in U.S.A.  
2 labs in UNITED KINGDOM  
1 lab in VIETNAM

## APPENDIX 3

### Abbreviations:

C	= final result after checking of first reported suspect result
D(0.01)	= outlier in Dixon's outlier test
D(0.05)	= straggler in Dixon's outlier test
G(0.01)	= outlier in Grubbs' outlier test
G(0.05)	= straggler in Grubbs' outlier test
DG(0.01)	= outlier in Double Grubbs' outlier test
DG(0.05)	= straggler in Double Grubbs' outlier test
fr	= first reported
E	= error in calculations
ex	= excluded from calculations
n.a.	= not applicable
fr	= first reported
U	= reported in different unit
SDS	= Safety Data Sheet
