1 INTRODUCTION

Since 2005, the Institute for Interlaboratory Studies organizes a proficiency test for automotive diesel containing 5 -10% FAME, according to EN590 and ASTM D7467 every year. In this interlaboratory study on gasoil B10, 60 laboratories from 30 countries have participated. See appendix 3 for the number of participating laboratories per country. In this report, the results of the Gasoil B10 proficiency test are presented and discussed.

2 SET UP

The Institute for Interlaboratory Studies (iis) in Spijkenisse, the Netherlands, was the organizer of this proficiency test. It was decided to evaluate the gasoil B10 according the (different) test scopes of both EN590:09 and ASTM D7467:10. It was decided to send one 0.5 litre and one 1 litre bottle of Gasoil B10 (both labelled #12060), and separately, one 1 litre bottle Gasoil (labelled #12061) specially for Total Contamination. Analyses for fit-for-use and homogeneity testing were subcontracted. Participants were requested to report rounded and unrounded results. The unrounded results were preferably used for the statistical evaluation.

2.1 ACCREDITATION

The Institute for Interlaboratory Studies in Spijkenisse, the Netherlands, is accredited in accordance with ISO/IEC17043:2010 and ILAC-G13:2007, (R007), since January 2000, by the Dutch Accreditation Council: RvA (Raad voor Accreditatie). This ensures strict adherence to protocols for sample preparation and statistical evaluation and 100% confidentiality of participant's data. Feedback from the participants on the reported data is encouraged and customer's satisfaction is measured on regular basis by sending out questionnaires.

2.2 PROTOCOL

The protocol followed in the organisation of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: 'Protocol for the Organisation, Statistics and Evaluation' of January 2010 (iis-protocol, version 3.2). This protocol can be downloaded from the iis website <http://www.iisnl.com>.

2.3 CONFIDENTIALITY STATEMENT

All data present in this report must be regarded as confidential and for use by the participating companies only. Disclosure of the information in this report is only allowed by means of the entire report. Use of the contents of this report for third parties is only allowed by written permission of the Institute for Interlaboratory Studies. Disclosure of the identity of one or more of the participating companies will be done only after receipt of a written agreement of the companies involved.

2.4 SAMPLES

The necessary bulk material (Gasoil with less than 0.5% FAME) was purchased from a local Gasoil producer. To 200 litre of the bulk material 20 litre of pure FAME (B100) was added to increase the FAME content upto 10%.

After homogenization, 103 subsamples were transferred to 1 litre brown glass bottles and labelled #12060. Another 96 bottles of 500 mL (also labelled #12060) were subsequently filled and another 50 bottles of one litre (labelled #12061) were filled with approx. 850 mL of material specially for Total Contamination.

The homogeneity of the subsamples #12060 (1 litre + ½ L) was checked by determination of Density in accordance with ISO12185:96.

	<i>Density @ 15 °C in kg/m³</i>
sample #12060-1	836.49
sample #12060-2	836.49
sample #12060-3	836.49
sample #12060-4	836.49
sample #12060-5	836.49
sample #12060-6	836.49
sample #12060-7	836.49
sample #12060-8	836.49

table 1: homogeneity test results of subsamples #12060

From the above test results, the repeatability was calculated and compared with 0.3 times the corresponding reproducibility in agreement with the procedure of ISO 13528, Annex B2 in the next table:

	<i>Density @ 15 °C in kg/m³</i>
r (sample #12060)	0.00
reference test	ISO12185:96
0.3 x R(reference test)	0.15

table 2: repeatability of the subsamples #12060

The calculated repeatability was less than 0.3 times the respective reproducibility of the reference method. Therefore, homogeneity of the subsamples #12060 was assumed.

For Total Contamination, each bottle (labelled #12061) was spiked with 1 ml of a freshly prepared and ultrasonically homogenized, 8.08 g/kg particulate quartz material BCR-067 (ϕ 2.4-32 μm) in oil suspension. The homogeneity was checked by weighing the bottles before and after addition of the spike.

Two bottles (1x1L + 1x0.5L, labelled #12060) and/or one bottle of 1L, labelled #12061 were sent to the participating laboratories on April 18, 2012.

2.5 STABILITY OF THE SAMPLES

The stability of Gasoil B10, packed in the brown glass bottles, was checked. The material was found sufficiently stable for the period of the proficiency test.

2.6 ANALYSIS

The participants were asked to determine, according specifications ASTM D7467 and EN590: Ash Content, Aromatics by FIA, Cetane Indices D976 and ISO4264, Cloud Point, Cold Filter Plugging Point, Conradson Carbon Residue on 10% Residue (ISO10370 and D524), Copper Corrosion, Density @ 15°C, Distillation, FAME, Flash Point PMcc, Kinematic Viscosity @40°C, Lubricity by HFRR @60°C , Oxidation Stability EN 15751 and ISO12205, Polycyclic Aromatic Hydrocarbons, Pour Point (manual and automated), Sulphur Content, TAN, Total Contamination and Water.

To get comparable results a detailed report form, on which the units were prescribed as well as some of the required standards, was sent together with each set of samples. Also, a letter of instructions and a SDS were added to the package.

3 RESULTS

During four weeks after sample despatch, the results of the individual laboratories were gathered. The original data are tabulated per determination in the appendix 1 of this report. The laboratories are presented by their code numbers.

Directly after deadline, a reminder fax was sent to those laboratories that had not yet reported.

Shortly after the deadline, the available results were screened for suspect data. A result was called suspect in case the Huber Elimination Rule (a robust outlier test) found it to be an outlier. The laboratories that produced these suspect data were asked to check the (raw data of the) reported results. Additional or corrected results have been used for data analysis and the original results are placed under 'Remarks' in the result tables in appendix 1.

3.1 STATISTICS

Statistical calculations were performed as described in the report 'iis Interlaboratory Studies: Protocol for the Organization, Statistics and Evaluation' of January 2010 (iis-protocol, version 3.2).

For the statistical evaluation the *unrounded* (when available) figures were used instead of the rounded results. Results reported as '<...' or '>...' were not used in the statistical evaluation.

First, the normality of the distribution of the various data sets per determination was checked by means of the Lilliefors-test. After removal of outliers, this check was repeated. Not all data sets proved to have a normal distribution, in which cases the conclusions of statistical evaluation should be used with due care.

In accordance with ISO 5725 (1986 and 1994) the original results per determination were subsequently submitted to Dixon and Grubbs outlier tests.

Outliers are marked by D(0.01) for the Dixon test, by G(0.01) or DG(0.01) for the Grubbs test. Stragglers are marked by D(0.05) for the Dixon test, by G(0.05) or DG(0.05) for the Grubbs test. Both outliers and stragglers were not included in the calculations of averages and standard deviations.

For each assigned value the uncertainty was determined in accordance with ISO13528. Subsequently the calculated uncertainty was evaluated against the respective requirement based on the target reproducibility in accordance with ISO13528. When the uncertainty passed the evaluation no remarks are made in the report. However, when the uncertainty failed the evaluation it is mentioned in the report and it will have consequences for the evaluation of the test results.

Finally, the reproducibilities were calculated from the standard deviations by multiplying them with a factor of 2.8.

3.2 GRAPHICS

In order to visualize the data against the reproducibilities from literature, Gauss plots were made, using the sorted data for one determination (see appendix 1). On the Y-axis the reported analysis results are plotted. The corresponding laboratory numbers are under the X-axis.

The straight horizontal line presents the consensus value (a trimmed mean). The four striped lines, parallel to the consensus value line, are the +3s, +2s, -2s and -3s target reproducibility limits of the selected standard. Outliers and other data, which were excluded from the calculations, are represented as a “x”. Accepted data are represented as a triangle. Furthermore, Kernel Density Graphs were made. This is a method for producing a smooth density approximation to a set of data that avoids some problems associated with histograms (see appendix 4; nr.13 and 14).

3.3 Z-SCORES

To evaluate the performance of the participating laboratories the z-scores were calculated. As it was decided to evaluate the performance of the participants in this proficiency test (PT) against the literature requirements, e.g. EN reproducibilities, the z-scores were calculated using a target standard deviation. This results in an evaluation independent of the spread of this interlaboratory study. The target standard deviation was calculated from the literature reproducibility by division with 2.8.

When a laboratory did use a test method with a reproducibility that is significantly different from the reproducibility of the reference test method used in this report, it is strongly advised to recalculate the z-score, while using the reproducibility of the actual test method used, this in order to evaluate the fit-for-useness of the reported test result.

The z-scores were calculated according to:

$$Z_{(\text{target})} = (\text{result} - \text{average of PT}) / \text{target standard deviation}$$

The $Z_{(\text{target})}$ scores are listed in the result tables in appendix 1.

Absolute values for $z < 2$ are very common and absolute values for $z > 3$ are very rare.

Therefore, the usual interpretation of z-scores is as follows:

$ z < 1$	good
$1 < z < 2$	satisfactory
$2 < z < 3$	questionable
$3 < z $	unsatisfactory

4 EVALUATION

In this proficiency test some problems with couriers and/or custom clearance were encountered during the execution. In total 12 participants reported test results after the final reporting date. All laboratories except 3 reported test results, but not all laboratories were able to perform all analyses requested. Finally, 57 participants reported in total 1197 numerical test results. Observed were 33 outlying results, which is 2.8%. In proficiency studies, outlier percentages of 3% - 7.5% are quite normal.

Not all original data sets proved to have a normal distribution. Non-Gaussian distributions were found for Ash Content, Cetane Index ISO4264, Cloud Point, Cold Filter Plugging Point, Density, Distillation 90% rec, Kinematic Viscosity, Polycyclic Aromatic Hydrocarbons, Pour Point (manual and automated), TAN and Water. Therefore, the statistical evaluation for these determinations should be used with care.

4.1 EVALUATION PER TEST

In this section, the results are discussed per test.

Ash: No significant conclusions were drawn as the consensus value is below the application range of the reference method. All participants, except 2, agreed that the ash content was equal or less than 0.001 %M/M.

Aromatics (FIA): This determination may be very problematic. One statistical outlier was observed. The calculated reproducibility is not at all in agreement with ASTM D1319:10, but the precision and bias of D1319:10 with biodiesel blends is not known and is currently under investigation, see paragraph X1.11.1 of ASTM D7467:10.

C.I. D976: This determination was not problematic. No statistical outliers were observed. And the calculated reproducibility is in good agreement with the requirements of ASTM D976:06. One laboratory used ASTM D4737. This test result was excluded from statistical evaluation because ASTM D4737 is not equal to ASTM D976.

C.I. ISO4264: Regretfully, no reproducibility limits are mentioned in ISO4264:07. It should be noted that the ASTM has repeatedly amended the calculations routines in ASTM D4737 to incorporate the various diesel oil specifications mentioned in ASTM D975. The last update of ISO4264 was in 2007, which is the current version (and technically equivalent to the 1996a version of ASTM D4737). In ISO4264 only one calculation routine is mentioned and in the latest ASTM D4737 (2010 version) two calculation routines are mentioned. The user should take care to use and report the correct method as required by clients.

- Cloud Point: This determination was not problematic. Only one statistical outlier was observed. The calculated reproducibility, after rejection of the statistical outlier, is in agreement with the requirements of EN23015:94 and of ASTM D2500:11.
- CFPP: This determination was not problematic. Two statistical outliers were observed. The calculated reproducibility, after rejection of the statistical outliers is in agreement with the requirements of EN116:97 and of IP309:99.
- CCR 10% res.: No significant conclusions were drawn as the carbon residue content was below the application range of the reference method. All participants agreed that Conradson Carbon Residue was near or less than 0.1 %M/M.
- Ramsbottom.: Only four laboratories reported a test result. The test results vary over a wide range (0.0049 – 0.10 %M/M). Therefore no significant conclusions were drawn.
- Copper Corr.: No problems were observed, almost participants agreed on a result of 1 or 1A. Only one participant reported Copper Corrosion as 1B.
- Density @15°C: This determination was not problematic. No statistical outlier was observed. And the calculated reproducibility is in good agreement with the requirements of ISO12185:96 and of ASTM D4052:11.
- FAME: This determination was problematic. Two statistical outliers were observed. The calculated reproducibility, after rejection of the statistical outliers, is not in agreement with the requirements of EN14078:09.
- Flash Point: This determination was not problematic. Only one statistical outlier was observed. The calculated reproducibility, after rejection of the statistical outlier, is in agreement with the requirements of ISO2719:02 and also in agreement with the requirements of ASTM D93A:11.
- Kin. Visc. 40°C: This determination was problematic. Three statistical outliers were observed. And the calculated reproducibility, after rejection of the statistical outliers, is not in agreement with the requirements of ISO3104:96 and also not in agreement with the requirements of ASTM D445:11.
- Lubricity: This determination was not problematic. Only one statistical outlier was observed. However, the calculated reproducibility, after rejection of the statistical outlier, is in good agreement with the requirements of ISO12156-1:06 and in agreement with the requirements of ASTM D6079:11.

Ox. Stab. EN15751: This determination was very problematic. One statistical outlier was observed. The calculated reproducibility, after rejection of the statistical outlier, is not at all in agreement with the requirements of EN15751:09.

Ox. Stab. ISO12205: This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility, after rejection of the statistical outliers, is in agreement with the requirements of ISO12205:95.

PAH: This determination was problematic. Only one statistical outlier was observed. However, the calculated reproducibility, after rejection of the statistical outlier, is not in agreement with the requirements of EN12916:06.

Pour Point (M): This determination was not problematic. No statistical outliers were observed. And the calculated reproducibility is in agreement with the requirements of ISO3016:94.

Pour Point (A): This determination was not problematic. Only one statistical outlier was observed. And the calculated reproducibility after rejection of the statistical outlier, is in agreement with the requirements of ASTM D5950:07. Remarkably two laboratories reported to have used ASTM D97:09, which is a manual test method. These results were excluded from the statistical evaluation and these test results were evaluated under the manual method.

Sulphur: This determination was not problematic. No statistical outliers were observed. And the calculated reproducibility, is in agreement with the requirements of ISO20846:11 and of ASTM D5453:09.

TAN: This determination was not problematic. Only one statistical outlier was observed. However, the calculated reproducibility, after rejection of the statistical outlier, is in agreement with the requirements of ASTM D664:11.
Nine laboratories used test method ASTM D974. These D974 test results were excluded from the statistical evaluation because ASTM D974 is not technically equivalent to ASTM D664.

Water: This determination was not problematic. Only one statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier, is in agreement with the requirements of EN12937:00.

Distillation: As only eight laboratories reported results from a manual distillation, these results are listed and evaluated together with the results of the automated distillation. Only the 10% recovery point was problematic. In total five statistical outliers were observed and the calculated reproducibilities of ibp, 50% rec., 90% rec., 95% rec, FBP, vol @250° and vol @350°, after

rejection of the statistical outliers, are all agreement with the requirements of ISO3405:11 (auto) and of ASTM D86:11 (auto).

Total Contamination: The samples were spiked with a freshly prepared and well shaken suspension of particulate quartz material (ϕ 2.4-32 μm) in oil. The Total Contamination concentration of the gasoil after spiking is 9.9 mg/kg. Surprisingly, the average concentration found by the participants was 57.8 mg/kg.

Serious analytical problems have been observed. Six statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers, is in not agreement with the requirements of EN12662:08.

The participants were asked to provide the version of the used method. Sixteen laboratories used EN12662:2008 and only three participants used EN12662:1998. Ten laboratories did not report the version of the used method.

Three laboratories reported that the filter was blocked after a certain amount of sample and one laboratory reported that the sample was not filterable at all. No correlation is visible between the quality of the test result and the version of EN12662 that was used.

4.2 PERFORMANCE EVALUATION FOR THE GROUP OF LABORATORIES

A comparison has been made between the reproducibility as declared by the relevant standard and the reproducibility as found for the group of participating laboratories that participated. The average results of the evaluated parameters, calculated reproducibilities and reproducibilities, derived from literature standards (in casu ASTM, EN or ISO standards) are compared in the next tables.

Parameters	unit	n	average	2.8 * sd	R (lit)
Ash content	%M/M	18	0.0007	0.0011	(0.0050) *
Aromatics by FIA	%V/V	13	23.95	11.27	unknown
Cetane Index D976		25	53.77	0.55	2.00
Cetane Index ISO4264		40	53.86	1.07	unknown
Cloud Point	°C	44	-8.58	2.41	4.00
Cold Filter Plugging Point	°C	43	-16.7	2.5	4.3
CCR on 10% residue	%M/M	28	0.043	0.050	(0.030) *
Ramsbottom CR on 10% residue	%M/M	4	0.07	n.a	n.a
Copper Corrosion 3hrs @ 50°C		47	1A	n.a	n.a
Density @ 15°C	kg/m ³	54	836.46	0.24	0.50
Fatty Acid Methyl Ester	%V/V	45	9.22	0.86	0.69
Flash Point PMcc	°C	53	64.38	3.23	4.57
Kinematic Viscosity @ 40°C	mm ² /s	46	2.7916	0.0243	0.0311
Lubricity	µm	39	186.6	51.0	102.0
Oxidation Stability EN15751	hrs	21	61.96	30.95	12.17
Oxidation Stability ISO12205	g/m ³	15	2.90	6.13	7.78
Polycyclic Aromatic Hydrocarbons	%M/M	28	2.79	1.17	0.98
Pour Point (manual)	°C	21	-22.90	5.52	6.60
Pour Point (automated)	°C	26	-21.42	3.47	4.50
Sulphur	mg/kg	44	7.08	2.06	2.76
Total Acid Number	mgKOH/g	23	0.040	0.035	0.049
Water	mg/kg	47	56.39	45.12	51.64
Initial Boiling Point	°C	52	175.03	9.35	9.63
10% recovery	°C	52	215.75	6.18	4.75
50% recovery	°C	50	276.46	2.48	2.97
90% recovery	°C	52	330.88	3.12	4.96
95% recovery	°C	49	342.69	3.90	8.57
Final Boiling Point	°C	52	351.79	6.33	7.10
Volume @250°C	%V/V	49	29.99	2.23	2.66
Volume @350°C	%V/V	42	96.63	2.01	2.66
Total Contamination (#12061)	mg/kg	18	57.85	25.64	17.36

Table 3: summary of test results samples #12060 and #12061

*) consensus value is below application range of the test method

Without further statistical calculations, it can be concluded that for most tests there is a good compliance of the group of participating laboratories with the relevant standards. The problematic tests have been discussed in paragraph 4.1.

4.3 COMPARISON OF THE INTERLABORATORY STUDY OF APRIL 2012 WITH PREVIOUS PTS.

	April 2012	April 2011	April 2010	April 2009	April 2008
Number of reporting labs	57	67	55	69	75
Number of results reported	1197	1363	1023	1059	1136
Statistical outliers	33	50	39	54	38
Percentage outliers	2.8%	3.7%	3.8%	5.1%	3.3%

table 4: comparison with previous proficiency tests.

In proficiency tests, outlier percentages of 3% - 7.5% are quite normal.

The performance of the determinations of the proficiency tests was compared against the requirements of the respective standards. The conclusions are given in the following table:

	April 2012	April 2011	April 2010	April 2009*	April 2008*
Ash content	(++)	(++)	(++)	(++)	(++)
Aromatics by FIA	n.e.	n.e.	n.e.	n.e.	n.e.
Cetane Index D976	++	++	++	n.e.	n.e.
Cetane Index ISO4264	n.e.	n.e.	n.e.	n.e.	n.e.
Conradson CR on 10% res.	(--)	(--)	(--)	(--)	(--)
Ramsbottom CR on 10% res.	n.e.	-	--	n.e.	n.e.
Cloud Point	+	++	++	++	++

Polycyclic Aromatic Hydrocar.	-	--	--	-	-
Pour Point manual	+	++	+	n.e.	n.e.
Pour Point automated	+	++	+/-	n.e.	n.e.
Sulphur	+	--	++	++	+/-
Total Contamination	-	--	--	--	--
TAN	+	(++)	++	n.e.	n.e.
Water content	+	++	++	++	++
Distillation	+	+/-	+/-	++	+/-

table 5: comparison determinations against the standard

* NB.: in 2007-2009 B5 was evaluated, not B10

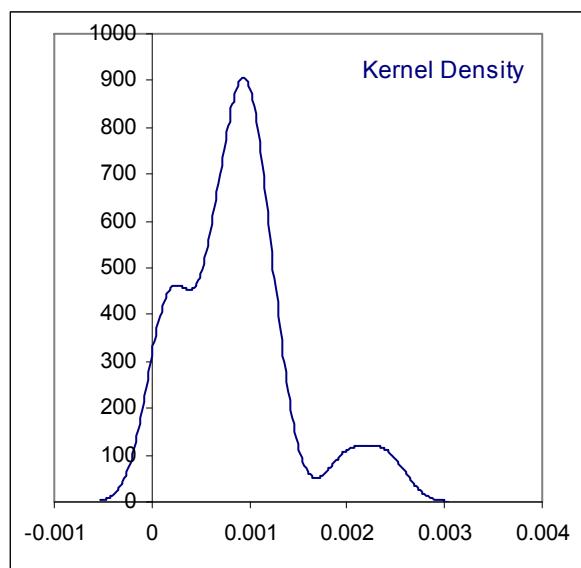

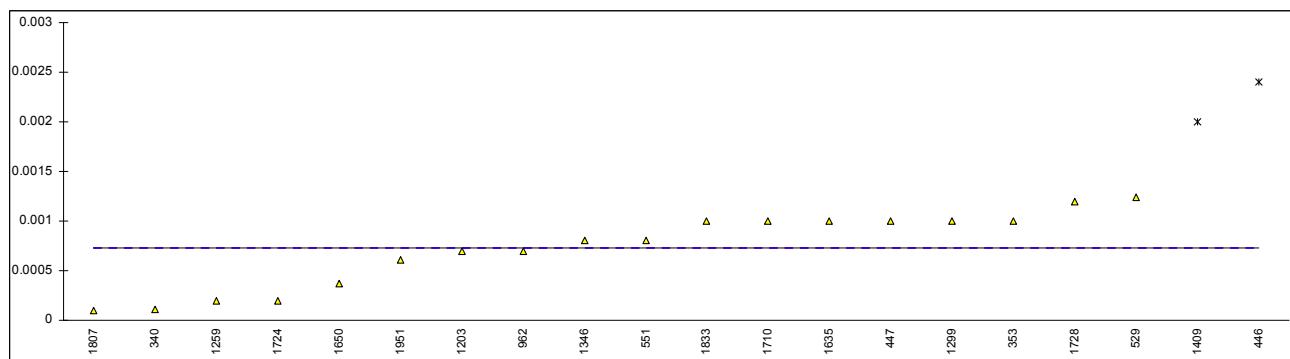

The performance of the determinations against the requirements of the respective standards is listed in the above table. The following performance categories were used:

- ++: group performed much better than the standard
- + : group performed better than the standard
- +/-: group performance equals the standard
- : group performed worse than the standard
- : group performed much worse than the standard
- n.e.: not evaluated

APPENDIX 3**Number of participants per country**

2 labs in AUSTRIA

4 labs in BELGIUM

1 lab in BRAZIL

2 labs in BULGARIA

2 labs in CROATIA

1 lab in CYPRUS

2 labs in CZECH REPUBLIC

2 labs in FRANCE

2 labs in GERMANY

2 labs in GREECE

4 labs in HUNGARY

1 lab in INDIA

1 lab in IRELAND

1 lab in ISRAEL

1 lab in MEXICO

1 lab in PHILIPPINES

1 lab in POLAND

1 lab in PORTUGAL

1 lab in REPUBLIC OF MACEDONIA

1 lab in ROMANIA

1 lab in SAUDI ARABIA

1 lab in SLOVAKIA

1 lab in SLOVENIA

5 labs in SPAIN

1 lab in SWEDEN

1 lab in TAIWAN R.O.C.

4 labs in THE NETHERLANDS

2 labs in TURKEY

1 lab in U.S.A.

10 labs in UNITED KINGDOM

APPENDIX 4**Abbreviations:**

C	= final result after checking of first reported suspect result
D(0.01)	= outlier in Dixon's outlier test
D(0.05)	= straggler in Dixon's outlier test
G(0.01)	= outlier in Grubbs' outlier test
G(0.05)	= straggler in Grubbs' outlier test
DG(0.01)	= outlier in Double Grubbs' outlier test
DG(0.05)	= straggler in Double Grubbs' outlier test
ex	= excluded from calculations
E	= error in calculations
n.a.	= not applicable
n.a.	= not evaluated
W	= result withdrawn
SDS	= Safety Data Sheet
