1 INTRODUCTION

Since 1999, the Institute for Interlaboratory Studies organizes proficiency tests for the analysis of Benzene and Toluene. In the annual proficiency testing program of 2012/2013, it was decided to continue the proficiency test for the analysis of Benzene and Toluene. In the interlaboratory study for Benzene 46 laboratories from 20 different countries have participated and for Toluene 39 participants in 19 countries have participated. See appendix 2 for the number of participants per country.

In this report, the results of the proficiency test Benzene and Toluene are presented and discussed. This report is also electronically available through the iis internet site www.iisnl.com.

2 SET UP

The Institute for Interlaboratory Studies (iis) in Spijkenisse, the Netherlands, was the organizer of this proficiency test. The analyses for fit-for-use and homogeneity determination were subcontracted to an accredited laboratory. It was decided to send one sample of Benzene (1 litre bottle, labelled # 13008) and/or one sample of Toluene (1 litre bottle, labelled # 13009) to the participants.

2.1 ACCREDITATION

The Institute for Interlaboratory Studies in Spijkenisse, the Netherlands, is accredited in agreement with ISO/IEC 17043:2010 (R007), since January 2000, by the Dutch Accreditation Council (Raad voor Accreditatie). This ensures strict adherence to protocols for sample preparation and statistical evaluation and 100% confidentiality of participant's data. Feedback from the participants on the reported data is encouraged and customer's satisfaction is measured on regular basis by sending out questionnaires.

2.2 PROTOCOL

The protocol followed in the organisation was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' of January 2010 (iis-protocol, version 3.2). This protocol can be downloaded via the FAQ page of the iis website <http://www.iisnl.com>.

2.3 CONFIDENTIALITY STATEMENT

All data presented in this report must be regarded as confidential and for use by the participating companies only. Disclosure of the information in this report is only allowed by means of the entire report. Use of the contents of this report for third parties is only allowed by written permission of the Institute for Interlaboratory Studies. Disclosure of the identity of

one or more of the participating companies will be done only after receipt of a written agreement of the companies involved.

2.4 SAMPLES

BENZENE

The necessary bulk material of Benzene was obtained from a local chemical supplier. The approximately 60 litre was spiked with 670.7 mg 1-Methyl-2-Pyrrolidinone (for the Nitrogen determination) and 432.9 mg o-Chlorotoluene (for the Organic Chlorine determination). The bulk sample was, after homogenisation, divided over 60 amber glass bottles of 1 litre, labelled #13008. The homogeneity of the subsamples #13008 was checked by determination of Total Nitrogen in accordance with ASTM D6069:06, Density @ 20°C in accordance with ASTM D4052:11 and Toluene content according to ASTM D4492:10, on 8 stratified randomly selected samples.

Benzene	Total Nitrogen in mg/kg	Density at 20°C in kg/L	Toluene in mg/kg
sample #13008-1	2.4	0.87895	475
sample #13008-2	2.4	0.87898	475
sample #13008-3	2.4	0.87897	486
sample #13008-4	2.4	0.87898	484
sample #13008-5	2.5	0.87898	475
sample #13008-6	2.4	0.87897	464
sample #13008-7	2.4	0.87898	484
sample #13008-8	2.4	0.87898	468

table 1: homogeneity test results of Benzene sub samples #13008

From the above test results the repeatabilities were calculated and compared with 0.3 times the corresponding reproducibilities of the target methods, in agreement with the procedure of ISO 13528, Annex B2 in the next table;

	Total Nitrogen in mg/kg	Density at 20°C in kg/L	Toluene in mg/kg
r (sample #13008)	0.1	0.00003	22
target	ASTM D6069:06	ASTM D4052:02e1	ASTM D4492:10
0.3*R (target)	0.3	0.00015	67

table 2: evaluation of repeatabilities of subsamples #13008

The calculated repeatabilities for sample #13008 were in agreement with 0.3 times the corresponding target reproducibility. Therefore, homogeneity of the samples was assumed.

TOLUENE

The necessary bulk material of Toluene was purchased from a local chemical supplier. The approximately 60 litre was, after homogenisation, divided over 60 brown glass bottles of 1 litre, labelled #13009. The homogeneity of the subsamples #13009 was checked by determination of Benzene, according to ASTM D2360:11 and Density @ 20°C according to ASTM D4052:11 on 8 stratified randomly selected samples.

Toluene	Benzene in mg/kg	Density at 20°C in kg/L
sample #13009-1	7610	0.86693
sample #13009-2	7620	0.86693
sample #13009-3	7640	0.86693
sample #13009-4	7630	0.86693
sample #13009-5	7570	0.86693
sample #13009-6	7660	0.86693
sample #13009-7	7630	0.86695
sample #13009-8	7630	0.86697

table 3: homogeneity test results of Toluene sub samples #13009

From the above test results the repeatabilities were calculated and compared with 0.3 times the corresponding reproducibilities of the target methods, in agreement with the procedure of ISO 13528, Annex B2 in the next table;

	Benzene In mg/kg	Density at 20°C in kg/L
r (sample #13009)	73	0.00004
target	Horwitz	ASTM D4052:02e
0.3*R (target)	267	0.00015

table 4: evaluation of repeatabilities of subsamples #13009

The calculated repeatability on Benzene for sample #13009 was in good agreement with 0.3 times the estimated target reproducibility, calculated using the Horwitz equation. And the calculated repeatability on Density for sample #13009 was in agreement with 0.3 times the corresponding target reproducibility. Therefore, homogeneity of the samples was assumed.

Depending on their registration to each of the participating laboratories one 1 litre bottle of Benzene labelled #13008 and/or one 1 litre bottle of Toluene labelled #13009 were sent on February 13, 2013.

2.5 STABILITY OF THE SAMPLES

The stability of Benzene and Toluene, packed in an amber glass bottles, was checked. The material was found sufficiently stable for the period of the proficiency test.

2.6 ANALYSES

The participants were requested to determine on the Benzene sample #13008: Acid Wash Color, Acidity, Appearance, Bromine Index, Color Pt-Co, Density @ 20°C, Distillation, Organic Chlorides, Total Chlorides, Total Nitrogen, Solidification Point, Methylcyclohexane, Toluene, Nonaromatics and Purity.

On Toluene sample #13009 were requested: Acid Wash Color, Appearance, Copper Corrosion, Color Pt-Co, Density @ 20°C, Distillation, Purity, Nonaromatics and Benzene.

To get comparable results a detailed report form, on which the units were prescribed as well as some of the required standards and a letter of instructions were prepared and made available for download on the iis website (www.iisnl.com).

A SDS and a form to confirm receipt of the samples were added to the sample package.

3 RESULTS

During four weeks after sample despatch, the results of the individual laboratories were received. The original reported results are tabulated per determination in appendix 1 of this report. The laboratories are presented by their code numbers.

Directly after the deadline, a reminder fax was sent to those laboratories that had not yet reported any results at that moment.

Shortly after the deadline, the available results were screened for suspect data. A result was called suspect in case the Huber Elimination Rule (a robust outlier test) found it to be an outlier. The laboratories that produced these suspect data were asked to check the results. Additional or corrected results are used for data analysis and original results are placed under 'Remarks' in the result tables in appendix 1.

3.1 STATISTICS

Statistical calculations were performed as described in the report 'iis Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' (iis-protocol, version 3.2) of January 2010.

For statistical evaluation the *unrounded* (when available) figures were used instead of the rounded results. Results reported as '<...' or '>...' were not used in the statistical evaluation.

First, the normality of the distribution of the various data sets per determination was checked by means of the Lilliefors-test. After removal of outliers this check was repeated. Not all data sets proved to have a normal distribution, in which cases the results of the statistical evaluation should be used with due care.

In accordance to ISO 5725 (1986 and 1994) the original results per determination were subsequently submitted to Dixon and Grubbs outlier tests. Outliers are marked by D(0.01) for the Dixon test and by G(0.01) or DG(0.01) for the Grubbs test. Stragglers are marked by D(0.05) for the Dixon test and by G(0.05) or DG(0.05) for the Grubbs test. Both outliers and stragglers were not included in the calculations of the averages and the standard deviations.

For each assigned value the uncertainty was determined in accordance with ISO13528. Subsequently the calculated uncertainty was evaluated against the respective requirement based on the target reproducibility in accordance with ISO13528. When the uncertainty passed the evaluation no remarks are made in the report. However, when the uncertainty failed the evaluation it is mentioned in the report and it will have consequences for the evaluation of the test results.

Finally, the reproducibilities were calculated from the standard deviations by multiplying these with a factor of 2.8.

3.2 GRAPHICS

In order to visualise the data against the reproducibilities from literature, Gauss plots were made, using the sorted data for one determination (see appendix 1). On the Y-axis the reported analysis results are plotted. The corresponding laboratory numbers are under the X-axis.

The straight horizontal line presents the consensus value (a trimmed mean). The four striped lines, parallel to the consensus value line, are the +3s, +2s, -2s and -3s target reproducibility limits of the selected standard. Outliers and other data, which were excluded from the calculations, are represented as a cross. Accepted data are represented as a triangle. Furthermore, Kernel Density Graphs were made. This method is for producing a smooth density approximation to a set of data that avoids some problems associated with histograms (see appendix 3; nos.14 and 15).

3.3 Z-SCORES

To evaluate the performance of the participating laboratories the z-scores were calculated. As it was decided to evaluate the performance of the participants in this proficiency test (PT) against the literature requirements, e.g. ASTM reproducibilities, the z-scores were calculated using a target standard deviation. This target standard deviation was calculated from the literature reproducibility by division with 2.8.

When a laboratory did use a test method with a reproducibility that is significantly different from the reproducibility of the reference test method used in this report, it is strongly advised to recalculate the z-score, while using the reproducibility of the actual test method used, this in order to evaluate the fit-for-useness of the reported test result.

The z-scores were calculated according to:

$$z_{(\text{target})} = (\text{result} - \text{average of PT}) / \text{target standard deviation}$$

Absolute values for $z < 2$ are very common and absolute values for $z > 3$ are very rare. Therefore, the usual interpretation of z-scores is as follows:

$ z < 1$	good
$1 < z < 2$	satisfactory
$2 < z < 3$	questionable
$3 < z $	unsatisfactory

4 EVALUATION

In this proficiency test, problems were encountered during the execution. Laboratories in Brazil, India, Oman and Saudi Arabia did receive the samples late or not at all due to courier problems and/or custom clearance. For sample #13008 (Benzene) and #13009 (Toluene), respectively five and four participants did not report any test results and four laboratories reported the test results after the final reporting date.

Finally, for sample #13008 (Benzene) and sample #13009 (Toluene) in total 686 results were submitted. Observed were in total 27 outlying results, which is 3.9%. In proficiency studies, outlier percentages of 3% - 7.5% are normal.

4.1 EVALUATION PER SAMPLE AND TEST

In this section, the results are discussed per sample and test. The methods, which are used by the various laboratories, were taken into account for explaining the observed differences when possible and applicable. These methods are also in the tables together with the original data. The abbreviations, used in these tables, are listed in appendix 3. In case no suitable test method is available, the Horwitz equation was used.

Not all original data sets proved to have a normal distribution. Not normal distributions were found for sample #13008: Bromine Index, Color Pt-Co, Density, Distillation (IBP, 50% and DP) and Toluene. For sample #13009 not normal distributions were found for: Color Pt-Co, Density and Distillation (IBP, 50% and DP). For these determinations the results of the statistical evaluation should be used with due care.

For Benzene sample #13008

Acid Wash Color: No analytical problems were observed. Twenty-four laboratories reported the Acid Wash Color as 1-. Other laboratories reported the Acid Wash Color as 0, 0+, -1. Two laboratories reported a less than test result, which is not in accordance with ASTM D848:09.

Acidity: This determination was not problematic. The way of reporting varies and should be improved in accordance with ASTM D847:08: report "no free acid" (NFA) or, when positive, "acidity as mg NaOH/100 mL". Two laboratories reported a false positive test result for this determination.

Appearance: No analytical problems were observed. All labs agreed about the appearance of the sample #13008, which was bright, clear and free of suspended matter.

Bromine Index: This determination was not problematic. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is agreement with the requirements of ASTM D5776:07e1.

Color Pt-Co: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in good agreement with the requirements of ASTM D1209:05e1.

Density @20°C: This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with the requirements of ASTM D4052:02e1. The current version of this method ASTM D4052:11 is being valid for gasolines, distillates, basestocks and lubricating oils. Therefore the reproducibility of this 2011 version may not be applicable for Benzene and Toluene.

Distillation: This determination was problematic for one laboratory. In total three statistical outliers were observed. The calculated reproducibilities for IBP 50% recovered and DP, after rejection of statistical outliers, are all in agreement with the requirements of ASTM D850:11. From the reported results of the 50% recovered, it appears that two participants obviously did not correct the results for barometric pressure and thermometer inaccuracy as described in ASTM D850-11 (paragraph 11.4).

Organic Chloride: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in agreement with the requirements of ASTM D5808:09a. The average recovery of Organic Chloride (theoretical increment of 1.99 mg/kg) may be good: "less than 129%" (the actual blank is unknown).

Total Chloride: This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of statistical outliers is in agreement with the requirements of ASTM D5194:11.

Total Nitrogen: This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of statistical outliers is in full agreement with the requirements of ASTM D6069:06. Two test results were excluded from statistical evaluation as the reported test method was not equivalent to ASTM D6069:06. The average recovery of Total Nitrogen (theoretical increment of 1.55 mg/kg) may be good: "less than 132%" (the actual blank is unknown).

Solidification Point: This determination was not problematic. Three statistical outliers were observed. However, the calculated reproducibility after rejection of statistical outliers is in agreement with the requirements of ASTM D852:08. Important in this solidification point determination is addition of water, the correct benzene container and the correction by 0.09°C.

Methylcyclohexane: This determination may be very problematic. One statistical outlier was observed. However, the calculated reproducibility after rejection of statistical outlier is not at all in agreement with the strict estimated reproducibility limits calculated using the Horwitz equation. It is remarkable that nine of the twenty-two laboratories used ASTM D4492, a

method that is not applicable for the determination of methyl cyclohexane, while only three laboratories used ASTM D5713 a method that is suitable for the determination of methyl cyclohexane.

Toluene: This determination was not problematic. Only one statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is in good agreement with the reproducibility of ASTM D4492:10.

Nonaromatics: This determination was very problematic. No statistical outliers were observed. However, the calculated reproducibility is not at all in agreement with the reproducibility of ASTM D4492:10.

Purity: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in agreement with the estimated reproducibility of ASTM D4492:10.

For Toluene sample #13009

Acid Wash Color: No analytical problems were observed. Twenty-two laboratories reported the Acid Wash Color as 1-. Other laboratories reported the Acid Wash Color as 0, 0+, <1. Two laboratories reported a less than test result, which is not in accordance with ASTM D848:09.

Appearance: No analytical problems were observed. All labs agreed about the appearance of the sample #13009, which was bright, clear and free of suspended matter. The uniformity of reporting can be improved.

Copper Corr: No problems have been observed. All participants agreed on a result of 1 or 1A. One laboratory reported according to ISO2160, a method that is not equivalent to ASTM D849:09.

Color Pt-Co: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in good agreement with the requirements of ASTM D1209:05e1.

Density @20°C: This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with the requirements of ASTM D4052:02e1. The current version of this method ASTM D4052:11 is being valid for gasolines, distillates, base stocks and lubricating oils. Therefore the reproducibility of this 2011 version may not be applicable for Benzene and Toluene.

Distillation: This determination was not problematic. From the reported results of the 50% recovered, it appears that four participants obviously did not correct the results for barometric pressure and thermometer inaccuracy as described in ASTM D850-11 (paragraph 11.4). In total seven statistical

outliers were observed. Six of the seven outliers are from two laboratories which did not correct for barometric pressure and thermometer inaccuracy. After applying the correction the calculated reproducibilities for IBP, 50% recovered and DP, are all in agreement with the requirements of ASTM D850:11.

Purity: This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in full agreement with the requirements of ASTM D6526:12. The reproducibility of ASTM D2360:11 is a fixed value at a purity of 99.94%. Therefore the reproducibility of ASTM D5626:12 was used. In this standard reproducibilities at three different concentrations are given.

Nonaromatics: This determination was not problematic. Only one statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is in good agreement with the requirements of ASTM D2360:11.

Benzene: This determination may be problematic at the high concentration of 7900 ppm. Two statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is not in agreement with the strict estimated reproducibility limits calculated using the Horwitz equation.

4.2 PERFORMANCE EVALUATION FOR THE GROUP OF LABORATORIES

A comparison has been made between the reproducibility as declared by the relevant standard and the reproducibility as found for the group of participating laboratories. The average results per sample, calculated reproducibilities and reproducibilities derived from literature standards (in casu ASTM standards) are compared in the next table.

Parameter	unit	n	average	$2.8 * s_{dR}$	R (lit)
Acid Wash Color		31	1-	n.a.	n.a.
Acidity	mgNaOH/100ml	32	no free acid	n.a.	n.a.
Appearance		34	pass	n.a.	n.a.
Bromine Index	mg Br/100g	30	3.48	3.37	4.60
Color Pt-Co		26	3.7	2.9	7.0
Density @ 20°C	kg/l	37	0.8789	0.0002	0.0005
Distillation, IBP	°C	28	79.78	0.25	0.42
Distillation, 50%	°C	28	80.09	0.17	0.42
Distillation, DP	°C	28	80.42	0.32	0.42
Organic Chloride	mg/kg	22	2.56	1.26	1.30
Total Chloride	mg/kg	8	2.80	0.71	0.90
Total Nitrogen	mg/kg	20	2.18	0.82	0.84
Solidification Point	°C	20	5.46	0.06	0.05
Methylcyclohexane	mg/kg	21	27.6	13.9	7.5
Toluene	mg/kg	36	486.0	91.3	226.2
Nonaromatics	mg/kg	36	155.5	87.7	38.8
Purity	%M/M	37	99.93	0.02	0.03

Table 5: reproducibilities of Benzene sample #1300

Parameter	unit	n	average	$2.8 * s_{dR}$	R (lit)
Acid Wash Color		30	1-	n.a.	n.a.
Appearance		28	pass	n.a.	n.a.
Copper corrosion		27	1(1A)	n.a.	n.a.
Color Pt-Co		23	4.5	3.9	7.0
Density @ 20°C	kg/L	31	0.8669	0.0002	0.0005
Distillation, IBP	°C	27	109.84	0.69	0.58
Distillation, 50% rec.	°C	27	110.57	0.24	0.16
Distillation, DP	°C	26	110.84	0.28	0.46
Purity	%M/M	28	99.13	0.12	0.11
Nonaromatics	mg/kg	29	326.2	85.2	156.0
Benzene	mg/kg	28	7909	1156	918

Table 6: reproducibilities of Toluene sample #13009

Without further statistical calculations, it can be concluded that for most of the tests there is a compliance of the group of participating laboratories with the relevant standards. The tests that are problematic have been discussed in paragraph 4.1.

4.3 COMPARISON OF THE PROFICIENCY TEST OF FEBRUARY 2013 WITH PREVIOUS PTS

	April 2013	April 2012	April 2011	April 2010
Number of reporting labs	41	46	45	44
Number of results reported	686	718	833	684
Statistical outliers	27	27	45	28
Percentage outliers	3.9%	3.8%	5.4%	4.1%

table 7: comparison with previous proficiency tests.

In proficiency tests, outlier percentages of 3% - 7.5% are quite normal.

The performance of the determinations of the proficiency tests was compared against the requirements of the respective standards. The conclusions are given in the following table:

	April 2013	April 2012	April 2011	April 2010
Acid Wash Color	n.e.	n.e.	++	++

APPENDIX 2**Number of participants in the Benzene PT**

2 labs in BELGIUM
2 labs in BRAZIL
1 lab in CANADA
2 labs in FRANCE
4 labs in GERMANY
3 labs in INDIA
1 lab in ISRAEL
1 lab in KOREA
2 labs in KUWAIT
1 lab in MALAYSIA
9 labs in P.R. of CHINA
1 lab in PORTUGAL
3 labs in SAUDI ARABIA
1 lab in SLOVAKIA
1 lab in SPAIN
1 lab in THAILAND
5 labs in THE NETHERLANDS
1 lab in TURKEY
3 labs in U.S.A.
2 labs in UNITED KINGDOM

Number of participants in the Toluene PT

1 lab in BELGIUM
2 labs in BRAZIL
1 lab in CANADA
2 labs in FRANCE
4 labs in GERMANY
2 labs in INDIA
1 lab in ISRAEL
1 lab in ITALY
1 lab in KOREA
9 labs in P.R. of CHINA
1 lab in POLAND
1 lab in SAUDI ARABIA
1 lab in SPAIN
1 lab in SULTANATE of OMAN
5 labs in THE NETHERLANDS
1 lab in TURKEY
3 labs in U.S.A.
1 lab in UNITED KINGDOM
1 lab in VIETNAM

APPENDIX 3

Abbreviations:

C	= final result after checking of first reported suspect result
D(0.01)	= outlier in Dixon's outlier test
D(0.05)	= straggler in Dixon's outlier test
G(0.01)	= outlier in Grubbs' outlier test
G(0.05)	= straggler in Grubbs' outlier test
DG(0.01)	= outlier in Double Grubbs' outlier test
DG(0.05)	= straggler in Double Grubbs' outlier test
fr	= first reported
E	= error in calculations
ex	= excluded from calculations
n.a.	= not applicable
fr	= first reported
U	= reported in different unit
SDS	= Safety Data Sheet
