## 1 INTRODUCTION

Since 1999, the Institute for Interlaboratory Studies (iis) organizes proficiency tests for the analysis of Benzene and Toluene every year. In the annual proficiency testing program of 2015/2016, it was decided to continue the proficiency test for the analysis of Benzene in accordance with the latest applicable specification for Benzene: ASTM D2359 and Toluene in accordance with the latest applicable specification for Toluene: ASTM D841. In the interlaboratory study for Benzene 52 laboratories from 20 different countries and for Toluene 41 participants in 20 countries registered for participation. See appendix 2 for the number of participants per country. In this report, the results of the proficiency test Benzene and Toluene are presented and discussed. This report is also electronically available through the iis website [www.iisnl.com](http://www.iisnl.com).

## 2 SET UP

The Institute for Interlaboratory Studies (iis) in Spijkenisse, the Netherlands, was the organizer of this proficiency test. The analyses of the samples for fit-for-use and homogeneity determination were subcontracted to an accredited laboratory. It was decided, depending on the registration, to send one sample of Benzene (1 litre bottle, labelled #16020) and/or one sample of Toluene (1 litre bottle, labelled #16021) to the participants. Participants were requested to report rounded and unrounded test results. The unrounded test results were preferably used for statistical evaluation

### 2.1 ACCREDITATION

The Institute for Interlaboratory Studies in Spijkenisse, the Netherlands, is accredited in agreement with ISO/IEC 17043:2010 (R007), since January 2000, by the Dutch Accreditation Council (Raad voor Accreditatie). This PT falls under the accredited scope. This ensures strict adherence to protocols for sample preparation and statistical evaluation and 100% confidentiality of participant's data. Feedback from the participants on the reported data is encouraged and customer's satisfaction is measured on regular basis by sending out questionnaires.

### 2.2 PROTOCOL

The protocol followed in the organisation of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' of April 2014 (iis-protocol, version 3.3). This protocol can be downloaded from the iis website [www.iisnl.com](http://www.iisnl.com), from the FAQ page.

## 2.3 CONFIDENTIALITY STATEMENT

All data presented in this report must be regarded as confidential and for use by the participating companies only. Disclosure of the information in this report is only allowed by means of the entire report. Use of the contents of this report for third parties is only allowed by written permission of the Institute for Interlaboratory Studies. Disclosure of the identity of one or more of the participating companies will be done only after receipt of a written agreement of the companies involved.

## 2.4 SAMPLES

### BENZENE

The necessary bulk material of Benzene was obtained from a local chemical supplier. The approximately 75 kg was spiked with 635.8 mg 1-Methyl-2-Pyrrolidinone (for the Nitrogen determination), 346.2 mg o-Chlorotoluene (for the Organic Chlorides determination) and 1753.4 mg Methylcyclohexane. The bulk sample was, after homogenisation, divided over 84 amber glass bottles of 1 litre, labelled #16020. The homogeneity of the subsamples #16020 was checked by determination of Density at 20°C in accordance with ASTM D4052, Toluene in accordance with ASTM D4492 and Total Nitrogen in accordance with ASTM D6069 on 8 stratified randomly selected samples.

|                 | Density at 20°C<br>in kg/L | Toluene<br>in mg/kg | Total Nitrogen<br>in mg/kg |
|-----------------|----------------------------|---------------------|----------------------------|
| sample #16020-1 | 0.87893                    | 251                 | 1.39                       |
| sample #16020-2 | 0.87894                    | 251                 | 1.37                       |
| sample #16020-3 | 0.87894                    | 249                 | 1.37                       |
| sample #16020-4 | 0.87895                    | 248                 | 1.37                       |
| sample #16020-5 | 0.87894                    | 252                 | 1.36                       |
| sample #16020-6 | 0.87894                    | 248                 | 1.37                       |
| sample #16020-7 | 0.87893                    | 248                 | 1.37                       |
| sample #16020-8 | 0.87893                    | 248                 | 1.37                       |

Table 1: homogeneity test results of Benzene sub samples #16020

From the above test results the repeatability was calculated and compared with 0.3 times the corresponding reproducibility of the reference test method, in agreement with the procedure of ISO 13528, Annex B2 in the next table;

|                               | Density at 20°C<br>in kg/L | Toluene<br>in mg/kg | Total Nitrogen<br>in mg/kg |
|-------------------------------|----------------------------|---------------------|----------------------------|
| r (observed)                  | 0.00002                    | 5                   | 0.02                       |
| Reference test method         | ISO12185:96                | ASTM 4492:10        | ASTM D6069:01              |
| 0.3*R (reference test method) | 0.00015                    | 35                  | 0.20                       |

Table 2: evaluation of repeatabilities of subsamples #16020

The calculated repeatabilities for sample #16020 were in agreement with 0.3 times the corresponding reproducibilities of the reference test methods. Therefore, homogeneity of the samples was assumed.

## TOLUENE

The necessary bulk material of Toluene was purchased from a local chemical supplier. The approximately 60 litre, after homogenisation, was divided over 56 brown glass bottles of 1 litre and labelled #16021. The homogeneity of the subsamples #16021 was checked by determination of Density at 20°C, according to ASTM D4052 on 8 stratified randomly selected samples.

| Toluene         | Density at 20°C<br>in kg/L |
|-----------------|----------------------------|
| sample #16021-1 | 0.86677                    |
| sample #16021-2 | 0.86677                    |
| sample #16021-3 | 0.86676                    |
| sample #16021-4 | 0.86677                    |
| sample #16021-5 | 0.86677                    |
| sample #16021-6 | 0.86677                    |
| sample #16021-7 | 0.86677                    |
| sample #16021-8 | 0.86677                    |

Table 3: homogeneity test results of Toluene subsamples #16021

From the above test results the repeatability was calculated and compared with 0.3 times the corresponding reproducibility of the reference test method, in agreement with the procedure of ISO 13528, Annex B2 in the next table;

|                               | Density at 20°C<br>in kg/L |
|-------------------------------|----------------------------|
| r (observed)                  | 0.00001                    |
| Reference test method         | ISO12185:96                |
| 0.3*R (reference test method) | 0.00015                    |

Table 4: evaluation of repeatability of subsamples #16021

The calculated repeatability on Density for sample #16021 was in agreement with 0.3 times the corresponding reproducibility of the reference test method. Therefore, homogeneity of the sub samples was assumed.

Depending on their registration to each of the participating laboratories one 1 litre bottle of Benzene labelled #16020 and/or one 1 litre bottle of Toluene labelled #16021 were sent on February 17, 2016.

## **2.5 STABILITY OF THE SAMPLES**

The stability of Benzene and Toluene, packed in amber glass bottles, was checked. The material was found sufficiently stable for the period of the proficiency test.

## 2.6 ANALYSES

The participants were requested to determine on the Benzene sample #16020: Acid Wash Color, Acidity, Appearance, Bromine Index, Total Chlorides, Organic Chlorides, Color Pt-Co, Density at 20°C, Distillation, Total Nitrogen, Purity, Methylcyclohexane, Toluene, Nonaromatics and Solidification Point.

On Toluene sample #16021 was requested: Acid Wash Color, Appearance, Color Pt-Co, Copper Corrosion, Density at 20°C, Distillation, Purity, Benzene, Nonaromatics and Refractive index.

To get comparable test results a detailed report form, on which the units were prescribed as well as the reference test methods and a letter of instructions were prepared and made available on the data entry portal [www.kpmd.co.uk/sgs-iis/](http://www.kpmd.co.uk/sgs-iis/). An SDS and a form to confirm receipt of the samples was added to the sample package.

## 3 RESULTS

During five weeks after sample dispatch, the test results of the individual laboratories were gathered via the data entry portal [www.kpmd.co.uk/sgs-iis/](http://www.kpmd.co.uk/sgs-iis/). The reported test results are tabulated per determination in appendix 1 of this report. The laboratories are presented by their code numbers.

Directly after the deadline, a reminder was sent to those laboratories that had not reported test results at that moment. Shortly after the deadline, the available test results were screened for suspect data. A test result was called suspect in case the Huber Elimination Rule (a robust outlier test) found it to be an outlier. The laboratories that produced these suspect data were asked to check the raw data of these tests (no reanalysis). Additional or corrected test results are used for data analysis and the original test results are placed under the test result tables in appendix 1. Test results that came in after the deadline were not taken into account in this screening for suspect data and thus these participants were not requested for checks.

### 3.1 STATISTICS

The protocol followed in the organization of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organization, Statistics and Evaluation' of April 2014 (iis-protocol, version 3.3). For the statistical evaluation the *unrounded* (when available) test results were used instead of the rounded test results. Test results reported as '<...' or '>...' were not used in the statistical evaluation.

First, the normality of the distribution of the various data sets per determination was checked by means of the Lilliefors-test a variant of the Kolmogorov-Smirnov test and by the calculation of skewness and kurtosis. Evaluation of the three normality indicators in combination with the visual evaluation of the graphic Kernel density plot, lead to judgment of the normality being either 'unknown', 'OK', 'suspect' or 'not OK'. After removal of outliers, this check was repeated. Not all data sets proved to have a normal distribution, in which cases the statistical evaluation of the test results should be used with due care.

In accordance with ISO 5725 the original test results per determination were submitted to Dixon's, Grubbs' and/or Rosner's outlier tests. Outliers are marked by D(0.01) for the Dixon test, by G(0.01) or DG(0.01) for the Grubbs test and by R(0.01) for the Rosner's test.

Stragglers are marked by D(0.05) for the Dixon test, by G(0.05) or DG(0.05) for the Grubbs test and by R(0.05) for the Rosner test. Both outliers and stragglers were not included in the calculations of averages and standard deviations.

For each assigned value, the uncertainty was determined in accordance with ISO13528. Subsequently the calculated uncertainty was evaluated against the respective requirement based on the target reproducibility in accordance with ISO13528. When the uncertainty passed the evaluation, no remarks are made in the report. However, when the uncertainty failed the evaluation it is mentioned in the report and it will have consequences for the evaluation of the test results.

Finally, the reproducibilities were calculated from the standard deviations by multiplying them with a factor of 2.8.

### 3.2 GRAPHICS

In order to visualize the data against the reproducibilities from literature, Gauss plots were made, using the sorted data for one determination (see appendix 1). On the Y-axis the reported test results are plotted. The corresponding laboratory numbers are on the X-axis. The straight horizontal line presents the consensus value (a trimmed mean). The four striped lines, parallel to the consensus value line, are the +3s, +2s, -2s and -3s target reproducibility limits of the selected reference test method. Outliers and other data, which were excluded from the calculations, are represented as an "cross". Accepted data are represented as a triangle. Furthermore, Kernel Density Graphs were made. The Kernel Density Graph is a method for producing a smooth density approximation to a set of data that avoids some problems associated with histograms. Also a normal Gauss curve was projected over the Kernel Density Graph for reference.

### 3.3 Z-SCORES

To evaluate the performance of the participating laboratories the z-scores were calculated. As it was decided to evaluate the performance of the participants in this proficiency test (PT) against the literature requirements, e.g. ASTM reproducibilities, the z-scores were calculated using a target standard deviation. This results in an evaluation independent of the variation of this interlaboratory study. The target standard deviation was calculated from the literature reproducibility by division with 2.8. In case no literature reproducibility was available, other target values were used. In some cases, a reproducibility based on former iis proficiency tests could be used.

When a laboratory did use a test method with a reproducibility that is significantly different from the reproducibility of the reference test method used in this report, it is strongly advised to recalculate the z-score, while using the reproducibility of the actual test method used, this in order to evaluate whether the reported test result is fit-for-use.

The z-scores were calculated in accordance with:

$$z_{(\text{target})} = (\text{test result} - \text{average of PT}) / \text{target standard deviation}$$

The  $z_{(\text{target})}$  scores are listed in the test result tables in appendix 1.

Absolute values for  $z < 2$  are very common and absolute values for  $z > 3$  are very rare.

The usual interpretation of z-scores is as follows:

- $|z| < 1$  good
- $1 < |z| < 2$  satisfactory
- $2 < |z| < 3$  questionable
- $3 < |z|$  unsatisfactory

## 4 EVALUATION

In this proficiency test, problems were encountered during the execution. Laboratories in Brazil, India, Portugal and United Kingdom did receive the samples late or not at all due to several reasons. For samples #16020 (Benzene) and #16021 (Toluene), respectively five and four participants did not report any test results and four (two for Benzene and two for Toluene) other laboratories reported the test results after the final reporting date.

Finally, for sample #16020 (Benzene) and sample #16021 (Toluene) in total 793 results were submitted. Observed were in total 19 outlying results, which is 2.4%. In proficiency studies, outlier percentages of 3% - 7.5% are normal.

### 4.1 EVALUATION PER SAMPLE AND TEST

In this section, the test results are discussed per sample and test. The methods, which are used by the various laboratories, were taken into account for explaining the observed differences when possible and applicable. These methods are also in the tables together with the original data. The abbreviations, used in these tables, are listed in appendix 3. When no suitable test method is available, the Horwitz equation was used.

In the iis PT reports, ASTM methods are referred to with a number (e.g. D5808) and an added designation for the year that the method was adopted or revised (e.g. D5808:09a). If applicable, a designation in parentheses is added to designate the year of reapproval (e.g. D5808:09a(2014)). In the results tables of Appendix 1 only the method number and year of adoption or revision e.g. D5808:09a will be used.

Not all original data sets proved to have a normal Gaussian distribution. These are referred to as "not OK" or "suspect". The statistical evaluation of these data sets should be used with due care, see also paragraph 3.1.

#### For Benzene sample #16020

Acid Wash Color: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in good agreement with the requirements of ASTM D848:14.

For the statistical analysis, the result expressed as y- or x+ was changed into a numerical value as follows: y- changed into y-0.25 and x+ into x+0.25.

- Acidity: This determination was not problematic. The majority of laboratories report “no free acid” (NFA) or 0 mg NaOH/100 ml in accordance with ASTM D847:15.
- Appearance: No analytical problems were observed. All labs agreed about the appearance of the sample #16020, which was bright, clear and free of suspended matter (Pass).
- Bromine Index: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in agreement with the requirements of ASTM D5776:14a.
- Total Chlorides: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in agreement with the requirements of ASTM D5194:13. The average recovery of Organic Chloride (theoretical increment of 1.30 mg/kg) may be good: “less than <102%” (the actual blank is unknown).
- Organic Chlorides: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in good agreement with the requirements of ASTM D5808:09a(2014). The average recovery of Organic Chloride (theoretical increment of 1.30 mg/kg) may be satisfactory: “less than 86%” (the actual blank is unknown).
- Color Pt-Co: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in good agreement with the requirements of ASTM D1209:05e1(2011) and of ASTM D5386:10.
- Density at 20°C: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in good agreement with the requirements of ISO12185:96.
- Distillation: This determination was not problematic. In total five statistical outliers were observed. However, all calculated reproducibilities after rejection of the statistical outliers are in good agreement with the requirements of ASTM D850:11 (Manual mode). From the reported results of the 50% recovered, it appears that one participant probably did not correct the results for barometric pressure and thermometer inaccuracy as described in ASTM D850 (paragraph 11).
- Total Nitrogen: This determination was problematic. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is not in agreement with the requirements of ASTM D6069:01(2006). However,

the calculated reproducibility is in agreement with the less strict requirements of ASTM D4629:12.

The average recovery of Total Nitrogen (theoretical increment of 1.20 mg/kg) may be good: "less than 104%" (the actual blank is unknown).

Purity: This determination was problematic. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is not in agreement with the estimated reproducibility of ASTM D4492:10.

Methylcyclohexane: This determination may not be problematic. No statistical outliers were observed. The calculated reproducibility is in agreement with the estimated reproducibility calculated using the Horwitz equation. The average recovery of Methylcyclohexane (theoretical increment of 23.5 mg/kg) may be good: "less than 100%" (the actual blank is unknown). It is remarkable that twenty-seven of the thirty-three laboratories used ASTM D4492, a method which may be not applicable for the determination of Methylcyclohexane, while only four laboratories used ASTM D5713 a method that is suitable for the determination of methyl Cyclohexane in benzene.

Toluene: This determination was not problematic. One statistical outlier was observed. However, the calculated reproducibility after rejection of the statistical outlier is in good agreement with the requirements of ASTM D4492:10.

Nonaromatics: This determination was problematic for a number of participants. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in full agreement with the requirements of ASTM D4492:10.

Solidification Point: This determination is not problematic. No statistical outliers were observed. The calculated reproducibility is in full agreement with the requirements of ASTM D852:13.

### **For Toluene sample #16021**

Acid Wash Color: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in agreement with the requirements of ASTM D848:14.

For the statistical analysis, the result expressed as y- or x+ was changed into numerical values as follows: y- changed into y-0.25 and x+ into x+0.25.

Appearance: No analytical problems were observed. All labs agreed about the appearance of the sample #16021, which was bright, clear and free of suspended matter (Pass).

Color Pt-Co: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in good agreement with the requirements of ASTM D1209:05e1(2011). One participant reported a result according ASTM D156, which is Saybolt Color.

Copper Corrosion: No problems have been observed. All participants agreed on a result of 1 or 1A.

Density at 20°C: This determination was not problematic. One statistical outlier was observed. However, the calculated reproducibility after rejection of the statistical outlier is in good agreement with the requirements of ISO12185:96.

Distillation: This determination was not problematic. In total only one statistical outlier was observed. All calculated reproducibilities after rejection of the statistical outlier, are in agreement with the requirements of ASTM D850:11 (automated mode).  
From the reported test results of the 50% recovered, it appears that one participant obviously did not correct the results for barometric pressure and thermometer inaccuracy as described in ASTM D850 (paragraph 11).

Purity: This determination was not problematic. One statistical outlier was observed. However, the calculated reproducibility after rejection of the statistical outlier is in agreement with the requirements of ASTM D2360:11.

Benzene: This determination may not be problematic. One statistical outlier was observed. However the calculated reproducibility after rejection of the statistical outlier is in full agreement with the estimated reproducibility limit calculated using the Horwitz equation.

Nonaromatics: This determination was not problematic. Three statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with the requirements of ASTM D2360:11.

Refractive Index: This determination was problematic. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is not in agreement with the requirements of ASTM D1218:12.

#### 4.2 PERFORMANCE EVALUATION FOR THE GROUP OF LABORATORIES

A comparison has been made between the reproducibility as declared by the relevant reference test method and the reproducibility as found for the group of participating laboratories. The average results per sample, calculated reproducibilities and reproducibilities derived from literature standards (in casu ASTM standards) are compared in the next table.

| Parameter              | unit          | n  | Average  | $2.8 * s_{dR}$ | R (lit) |
|------------------------|---------------|----|----------|----------------|---------|
| Acid Wash Color        |               | 42 | 0.8 (1-) | 0.6            | 2.2     |
| Acidity                | mg NaOH/100ml | 38 | NFA      | n.a.           | n.a.    |
| Appearance             |               | 40 | Pass     | n.a.           | n.a.    |
| Bromine Index          | mg Br/100g    | 35 | 2.4      | 2.8            | 4.6     |
| Total Chlorides        | mg/kg         | 5  | 1.33     | 0.79           | 0.90    |
| Organic Chlorides      | mg/kg         | 26 | 1.11     | 0.49           | 1.30    |
| Color Pt-Co            |               | 31 | 4.9      | 3.1            | 7.0     |
| Density at 20°C        | kg/L          | 42 | 0.8790   | 0.0002         | 0.0005  |
| Distillation, IBP      | °C            | 29 | 79.8     | 0.1            | 0.4     |
| Distillation, 50% rec. | °C            | 30 | 80.1     | 0.1            | 0.4     |
| Distillation, DP       | °C            | 29 | 80.2     | 0.2            | 0.4     |
| Total Nitrogen         | mg/kg         | 29 | 1.24     | 0.66           | 0.48    |

Table 6: reproducibilities on Toluene sample #16021

Without further statistical calculations, it can be concluded that for most of the tests there is a compliance of the group of participating laboratories with the relevant standards. The tests that are problematic have been discussed in paragraph 4.1.

#### 4.3 COMPARISON OF THE PROFICIENCY TEST OF MARCH 2016 WITH PREVIOUS PTS

|                                | March 2016 | February 2015 | February 2014 | April 2013 |
|--------------------------------|------------|---------------|---------------|------------|
| Total Number of reporting labs | 59         | 51            | 58            | 41         |
| Number of results reported     | 793        | 729           | 800           | 686        |
| Statistical outliers           | 19         | 15            | 36            | 27         |
| Percentage outliers            | 2.4%       | 2.1%          | 4.5%          | 3.9%       |

Table 7: comparison with previous proficiency tests.

In proficiency tests, outlier percentages of 3% - 7.5% are quite normal.

The performance of the determinations of the proficiency tests was compared against the requirements of the respective standards. The conclusions are given in the following table:

|                      | March 2016 | February 2015 | February 2014 | April 2013 |
|----------------------|------------|---------------|---------------|------------|

Table 9: comparison determinations on Toluene against the standards  
\*) against the strict Horwitz equation

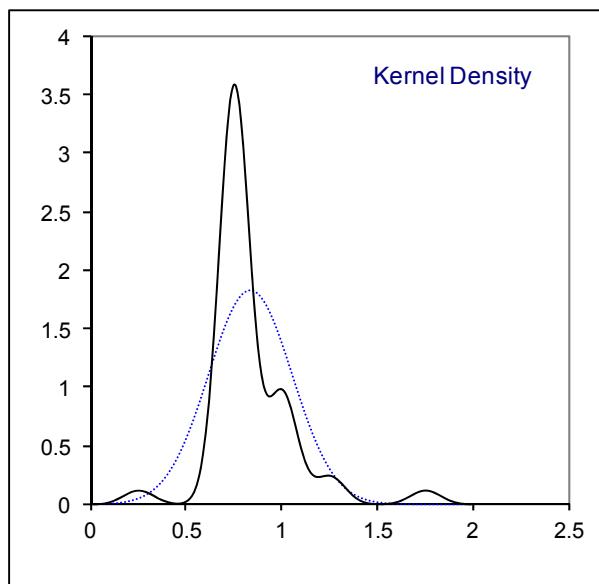

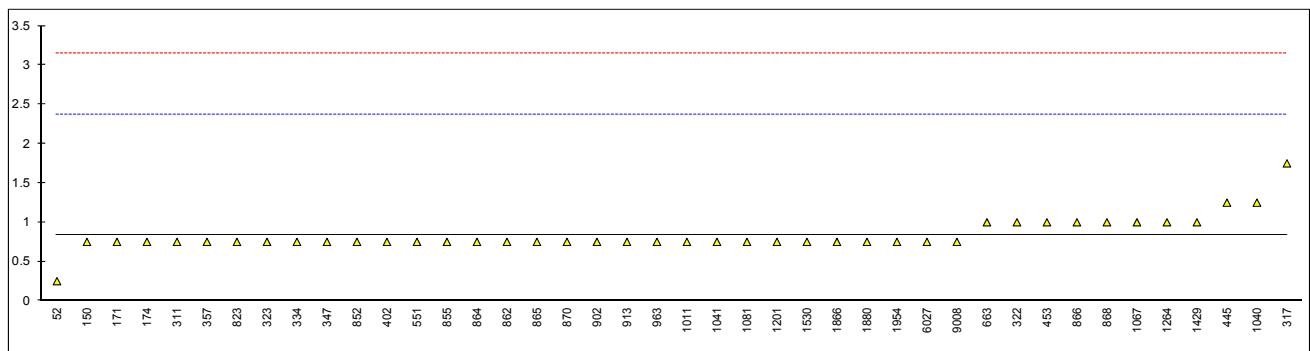

The performance of the determinations against the requirements of the respective standards is listed in the above table. The following performance categories were used:

- ++: group performed much better than the standard
- + : group performed better than the standard
- +/-: group performance equals the standard
- : group performed worse than the standard
- : group performed much worse than the standard
- n.e.: not evaluated

**APPENDIX 1****Determination of Acid Wash Color (acid layer) on Benzene sample #16020**

## APPENDIX 2

### Number of participants in the Benzene PT

1 lab in BELGIUM  
2 labs in BRAZIL  
1 lab in CANADA  
10 labs in CHINA, People's Republic  
1 lab in FINLAND  
3 labs in FRANCE  
3 labs in GERMANY  
3 labs in INDIA  
2 labs in KUWAIT  
8 labs in NETHERLANDS  
1 lab in PORTUGAL  
1 lab in ROMANIA  
4 lab in SAUDI ARABIA  
1 lab in SOUTH KOREA  
1 lab in SPAIN  
1 lab in THAILAND  
1 lab in TURKEY  
1 lab in UNITED ARAB EMIRATES  
4 labs in UNITED KINGDOM  
3 labs in UNITED STATES OF AMERICA

### Number of participants in the Toluene PT

1 lab in AUSTRALIA  
1 lab in BELGIUM  
3 labs in BRAZIL  
1 lab in CANADA  
7 labs in CHINA, People's Republic  
1 lab in ESTONIA  
2 labs in FRANCE  
4 labs in GERMANY  
2 labs in INDIA  
3 labs in NETHERLANDS  
1 lab in PORTUGAL  
1 lab in ROMANIA  
2 labs in SAUDI ARABIA  
1 lab in SOUTH KOREA  
1 lab in SPAIN  
1 lab in THAILAND  
1 lab in TURKEY  
3 labs in UNITED KINGDOM  
4 labs in UNITED STATES OF AMERICA  
1 lab in VIETNAM

**APPENDIX 3****Abbreviations:**

|          |   |
|----------|---|
| C        | = final test result after checking of first reported suspect result |
| D(0.01)  | = outlier in Dixon's outlier test                                   |
| D(0.05)  | = straggler in Dixon's outlier test                                 |
| G(0.01)  | = outlier in Grubbs' outlier test                                   |
| G(0.05)  | = straggler in Grubbs' outlier test                                 |
| DG(0.01) | = outlier in Double Grubbs' outlier test                            |
| DG(0.05) | = straggler in Double Grubbs' outlier test                          |
| R(0.01)  | = outlier in Rosner outlier test                                    |
| R(0.05)  | = straggler in Rosner outlier test                                  |
| E        | = probably an error in calculations                                 |
| U        | = test result probably reported in a different unit                 |
| W        | = test result withdrawn on request of participant                   |
| ex       | = test result excluded from calculations                            |
| n.a.     | = not applicable  |
| n.d.     | = not detected  |
| fr.      | = first reported  |
| SDS      | = Safety Data Sheet   |
