1 INTRODUCTION

Phthalates act as softeners and are commonly used as plasticizers in PVC. Phthalates may migrate fairly easily from PVC into the environment. Because phthalates appeared to have negative effects on health and the environment, regulations have been set up.

In Europe, the Commissioner for Industrial Affairs of the EC is responsible for toy regulations. The manufacture and import of toys is regulated by the European Union's Toy Directive (88/378), with in addition the general product safety, which is covered by EU directive 2001/95 and Council Directive + amendments 76/769/EEC. These regulations govern conditions related to toys intended for children under 36 months of age (this group often suck or chew on toys and phthalates migrate easily). Therefore plastic toys are not allowed to contain either more than 0.1 %M/M of DEHP, DBP and BBP combined or more than 0.1%M/M of DINP, DIDP and DNOP combined.

• bis(2-ethylhexyl)phthalate (DEHP) ¹⁾	CASno. 117-81-7	EINECS no. 204-211-0
• dibutylphthalate (DBP)	CASno. 84-74-2	EINECS no. 201-557-4
• benzylbutylphthalate (BBP)	CASno. 85-68-7	EINECS no. 201-622-7
• di-isonylphthalate (DINP)	CASno. 28553-12-0	EINECS no. 249-079-5
• di-isodecylphthalate (DIDP)	CASno. 26761-40-0	EINECS no. 247-977-1
• di-n-octylphthalate (DNOP)	CASno. 117-84-0	EINECS no. 204-214-7

¹⁾ DEHP is also known as di-(iso)-octylphthalate (DOP).

The determination of phthalates in plastics is known to give problems with the comparability of laboratory results. However, no appropriate PVC reference materials are available (ref. 20). As an alternative, participation in a proficiency test may enable laboratories to check this comparability. Therefore, a proficiency test (laboratory-evaluating interlaboratory study) for the determination of individual phthalates in plastics was again organized by the Institute for Interlaboratory Studies in February 2009.

In the present international interlaboratory study of February 2009, 103 laboratories in 27 different countries have participated. See appendix 3 for a list of the number of participating laboratories per country. In this report the results of the proficiency test are presented and discussed.

2 SET UP

The Institute for Interlaboratory Studies in Spijkenisse was the organiser of this proficiency test. It was decided to send two different plastics samples (approximately 3 grams each), labelled #0913 PVC and #0914 PP.

Sample #0914 was prepared by a third party laboratory, especially for the determination of different phthalates. Analyses were subcontracted to an accredited laboratory.

Participants were requested to report some additional details of the methods used.

2.1 QUALITY SYSTEM

The Institute for Interlaboratory Studies in Spijkenisse, the Netherlands, has implemented a quality system based on ISO guide 43 and ILAC-G13:2000. This ensures 100% confidentiality of participant's data. Also customer's satisfaction is measured on a regular basis by sending out questionnaires.

2.2 PROTOCOL

The protocol followed in the organisation of this proficiency test was the one as described for proficiency testing in the report 'i.i.s. Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' of November 2008 (i.i.s.-protocol, version 3.1).

2.3 CONFIDENTIALITY STATEMENT

All data present in this report must be regarded as confidential and for use by the participating companies only. Disclosure of the information in this report is only allowed by means of the entire report. Use of the contents of this report for third parties is only allowed by written permission of the Institute of Interlaboratory Studies. Disclosure of the identity of one or more of the participating companies will be done only after receipt of a written agreement of the companies involved.

2.4 SAMPLES

Two samples were prepared from two different bulk materials.

The first bulk material was a purple coloured PVC child toy, which was found to be positive on phthalates. The material was cut into pieces and after homogenisation divided over 122 plastic bags of 3 gram each and labelled #0913.

The second bulk material was a yellow polypropylene granulate, to which known amounts of DBP, BBP and DEHP were added. The bulk materials were thoroughly mixed and subsequently distributed over plastic bags (3 gram each) and labelled #0914.

The homogeneity of the subsamples was checked by determination of total phthalates on 4 stratified random selected subsamples for #0913 and by the determination of DBP on 3 stratified random selected subsamples for #0914 using EN14372:04.

	Total Phthalates in %M/M
Sample #0913-1	19.2
Sample #0913-2	19.0
Sample #0913-3	19.1
Sample #0913-4	19.5

Table 1: results of the homogeneity test on the subsamples #0913

	DBP in %M/M
Sample #0914-1	0.250
Sample #0914-2	0.260
Sample #0914-3	0.251

Table 2: results of the homogeneity test on the subsamples #0914

From the results of the homogeneity tests, the repeatabilities were calculated:

	Total Phthalates in %M/M #0913	DBP in %M/M #0914
r (observed)	0.6	0.015
reference method	EN14372:04	EN14372:04
r (reference method)	1.9	0.025

Table 3: repeatabilities of DEHP and BBP contents of the subsamples #0913 and #0914

The calculated repeatabilities are in agreement with the requirements of EN14372:04.

Therefore, homogeneity of subsamples #0913 and #0914 was assumed.

To each of the participating laboratories, one sample of approx. 3 grams of sample of #0913 and 3 grams of sample of #0914 were sent on February 11, 2009.

2.5 ANALYSIS

The participants were requested to determine six individual phthalates (DINP, DBP, BBP, DIDP, DNOP, DEHP) and other phthalates on samples #0913 and #0914.

The participants were explicitly asked to treat the samples as if they were routine samples and to report the analytical results using the indicated units on the report form and not to round the results, but report as much significant figures as possible.

The participants were also asked not to report 'less than' results which are above the detection limit, because such results can not be used for meaningful statistical calculations.

To get comparable results a detailed report form, on which the units were prescribed, was sent together with each set of samples. Also a letter of instructions was added to the package.

The laboratories were asked to complete the report form with the requested details of the methods used.

3 RESULTS

During four weeks after sample despatch the results of the individual laboratories were received. The original data are tabulated per sample in the appendix 1 of this report. The laboratories are presented by their code numbers.

Directly after deadline, a reminder fax was sent to those laboratories that did not report results at that moment. Shortly after the deadline the available results were screened for suspect data. A result was called suspect in case the Huber Elimination Rule (a robust outlier test) found it to be an outlier. The laboratories that produced these suspect data were asked to check the

results. Additional or corrected results are used for the data analysis and the original results are placed under 'Remarks' in the result tables in appendix 1.

3.1 STATISTICS

For the statistical evaluation the *unrounded* (when available) figures were used instead of the rounded results. Results reported as '<...' or '>...' were not used in the statistical evaluation.

First the normality of the distribution of the various data sets per determination was checked by means of the Lilliefors-test. After removal of outliers, this check was repeated.

Not all data sets proved to have a normal distribution, in which cases the statistical evaluation of the results should be used with due care.

In accordance to ISO 5725 (1986 and 1994) the original results per determination were submitted subsequently to Dixon and Grubbs outlier tests. Outliers are marked by D(0.01) for the Dixon test, by G(0.01) or DG(0.01) for the Grubbs test. Stragglers are marked by D(0.05) for the Dixon test, by G(0.05) or DG(0.05) for the Grubbs test. Both outliers and stragglers were not included in the calculations of averages and standard deviations.

Finally the reproducibilities were calculated from the standard deviations by multiplying them with a factor of 2.8.

Statistical calculations were performed as described in the report 'i.i.s. Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' of November 2008 (i.i.s.-protocol, version 3.1).

3.2 GRAPHICS

In order to visualise the data against the reproducibilities from literature, Gauss plots were made, using the sorted data for one determination (see appendix 1). On the Y-axis the results are plotted. The corresponding laboratory numbers are under the X-axis. A straight line presents the average of the reported data. Two striped lines present the reproducibility limits of the selected standard, calculated as mean \pm target reproducibility, parallel to the average line. Outliers and other data, which were excluded from the calculations, are represented as a cross. Accepted data are represented as a triangle.

Furthermore, Kernel Density Graphs were made. This is a method for producing a smooth density approximation to a set of data that avoids some problems associated with histograms (see appendix 4; nr.17 and 18).

3.3 Z-SCORES

To evaluate the performance of the participating laboratories the z-scores were calculated. As it was decided to evaluate the performance of the participants in this proficiency test (PT) against the literature requirements, e.g. ASTM reproducibilities, the z-scores were calculated using a target standard deviation. This results in an evaluation independent of the spread of this

interlaboratory study. The target standard deviation was calculated from the literature reproducibility by division with 2.8.

In case no literature reproducibility was available, other target values were used. In some cases literature repeatability is available; in other cases a reproducibility of a former iis proficiency test could be used and also the Horwitz equation can be used to estimate target reproducibility.

The z-scores were calculated according to:

$$z_{(\text{target})} = (\text{result} - \text{average of PT}) / \text{target standard deviation}$$

Absolute values for $z < 2$ are very common and absolute values for $z > 3$ are very rare. The usual interpretation of z-scores is as follows:

$ z < 1$	good
$1 < z < 2$	satisfactory
$2 < z < 3$	questionable
$3 < z $	unsatisfactory

4 EVALUATION

In this interlaboratory study no problems were encountered during the execution.

Only one participant did not send in any results. Finally 102 of the 103 participating laboratories reported 797 numerical results. Observed were 33 outlying results, which is 4.1%. In proficiency studies outlier percentages of 3% - 7.5% are quite normal.

4.1 EVALUATION PER PHTHALATE/SAMPLE

In this section the results are discussed per component.

For evaluation of the results of this Interlaboratory Study, the requirements from the standardised method EN14372:04, "Child use and care articles, Cutlery and feeding utensils, Safety requirements and tests" were used. Regretfully, only a relative within-laboratory standard deviation RSD_r is given in this Standard. Multiplication of the RSD_r by 2.8 gives the repeatability. Multiplication of the repeatability by 3 gives the estimate of the target reproducibility. For comparison also a target reproducibility based on the Horwitz equation is given for each phthalate.

Because EN14372 describes only a releasing method by Soxhlet extraction using diethylether, only the results of laboratories that used this Soxhlet method using diethylether as extraction solvent were used to determine the assigned values. The results of participants that used a deviating releasing method were excluded (marked ex) from the statistical calculations to determine the assigned values.

EVALUATION OF PVC SAMPLE #0913:

DINP: This determination seems problematic at a concentration level of 0.03-0.04%M/M in PVC. The calculated reproducibility of the total group is, after rejection of the statistical outliers, not in agreement with the estimated requirements of EN14372:04. The effect of the phthalate releasing technique appears to be not significant. When the EN14372 results are evaluated separately, the assigned value is not significantly different from the assigned value for the all reported results. Also, the observed spread is not significantly different. The large spread may be explained by the low concentration (<0.05%M/M).

This low concentration will not allow positive identification of DINP as was remarked by several laboratories.

DBP: This determination is not problematic at a level of 14%M/M in PVC for the laboratories that used the EN14372 method. However, for all other methods used, this determination is very problematic as all observed reproducibilities are much larger than the estimated EN14372 requirement. The calculated reproducibility of the total group is, after rejection of the statistical outliers, not at all in agreement with the estimated requirements of EN14372:04.

The effect of the phthalate releasing technique appears to be significant. When the reported results are evaluated per technique, the assigned value for the EN14372 results is highest of all results and the assigned value for the Ultrasonic extraction results is smallest of all results. The relative spread of EN14372 results is much smaller than the spreads of all other methods.

DEHP: This determination is problematic at a concentration level of 5.5%M/M in PVC as all observed reproducibilities are larger than the estimated EN14372 requirement. The calculated reproducibility of the total group is, after rejection of the statistical outliers, not at all in agreement with the estimated requirements of EN14372:04.

The effect of the phthalate releasing technique appears to be significant. When the reported results are evaluated per technique, the assigned value for the EN14372 results is highest of all results and the assigned value for the Ultrasonic extraction results is smallest of all results. The relative spread of EN14372 results is smaller than the spreads of all other methods.

DIBP: In total 23 laboratories reported the presence of one or 2 isomers of DIBP, being di-isobutyl phthalate (CAS 84.69.5) and n-butyl isobutyl phthalate (CAS 17851.53.5). This determination is problematic at a concentration level of 2.3%M/M in PVC. The calculated reproducibility of the total group is, after rejection of the statistical outliers, not at all in agreement with the estimated requirements of EN14372:04. It is however not clear whether all 23 laboratories reported the sum of both isomers.

EVALUATION OF PP SAMPLE #0914:

- DBP: This determination is problematic at a level of 0.24%M/M in PP as all observed reproducibilities are larger than the estimated EN14372 requirement..
The calculated reproducibility of the total group is, after rejection of the statistical outliers, not at all in agreement with the estimated requirements of EN14372:04.
The effect of the phthalate releasing technique appears to be significant. When the reported results are evaluated per technique, the assigned value for the THF results is smallest of all results and the relative spread of THF results is much larger than the spreads of all other methods.
- BBP: This determination is problematic at a concentration level of 0.17-0.23%M/M in PP.
The calculated reproducibility of the total group is, after rejection of the statistical outliers, not at all in agreement with the estimated requirements of EN14372:04.
The effect of the phthalate releasing technique appears to be significant. When the reported results are evaluated per technique, the assigned value for the THF results is smallest of all results and the relative spread of THF results is much larger than the spreads of all other methods.
- DEHP: This determination is problematic at a concentration level of 0.08-0.12%M/M in PP as all observed reproducibilities are larger than the estimated EN14372 requirement. The calculated reproducibility of the total group is, after rejection of the statistical outliers, not at all in agreement with the estimated requirements of EN14372:04.
The effect of the phthalate releasing technique appears to be not significant at this low phthalate level.

4.2 PERFORMANCE EVALUATION FOR THE GROUP OF LABORATORIES

A comparison has been made between the reproducibilities as found for the group of participating laboratories (also per extraction method) and the estimated reproducibilities of EN14372:2004 are compared in the next tables:

Parameter	Unit	n	Average	2.8 * sd	R (target)
DINP – EN14372	%M/M	30	0.034	0.024	0.009
DINP – all results	%M/M	59	0.035	0.025	0.009
DBP – EN14372	%M/M	35	14.02	3.10	3.53
DBP – all results	%M/M	100	13.15	6.69	3.31
DBP – Soxhlet, EN14372 excl.	%M/M	16	12.21	7.43	3.20
DBP – THF extraction	%M/M	23	13.70	7.10	3.45
DBP – Ultrasonic extraction	%M/M	14	12.10	7.26	3.05
DEHP – EN14372	%M/M	36	5.55	2.04	1.40
DEHP – all results	%M/M	100	5.33	3.44	1.34
DEHP – Soxhlet, EN14372 excl.	%M/M	14	5.48	2.52	1.38
DEHP – THF extraction	%M/M	23	5.52	3.00	1.39
DEHP – Ultrasonic extraction	%M/M	13	5.20	2.20	1.31
DIBP – all results	%M/M	23	2.32	3.82	0.59

Table 4: sample #0913

Parameter	Unit	n	Average	2.8 * sd	R (target)
DBP – EN14372	%M/M	35	0.24	0.08	0.06
DBP – all results	%M/M	92	0.21	0.14	0.05

Table 5: sample #0914

4.3 COMPARISON WITH PREVIOUS INTERLABORATORY STUDIES

	February 2009	February 2008	February 2007	March 2006
Number of reporting labs	102	78	67	51
Number of results reported	797	760	394	329
Statistical outliers	33	25	31	17
Percentage outliers	4.1%	3.3%	7.9%	5.2%

Table 6: comparison with previous proficiency tests

In proficiency tests, outlier percentages of 3% - 7.5% are quite normal.

In comparison with previous proficiency tests, significant improvements are observed for the evaluated components, see below table.

Parameter	February 2009	February 2008	February 2007	March 2006	March 2005
DINP	(71%)*	72%	104%/(189%) *	76%	--
DBP	22%/33%	41%	--	54%	54%
DEHP	36%/(73%)*	54%	53%/59%	49%/39%	59%/49%
BBP	48%	64%	--	--	--
DIDP	--	51%	--	--	--
DIBP	--	--	--	38%	28%

Table 7: Relative reproducibilities of detected phthalates for last years

(X)* concentration of the component is near or below 0.1%M/M

5 CONCLUSIONS

In this proficiency test for the determination of phthalates in plastic, it was noticed that almost all the participants found all phthalates present in both samples #0913 and #0914.

The determination of phthalates in plastics seems again problematic as in previous years. The reported details of the methods, which were used by the participants, are listed in appendix 3.

The techniques to release the phthalates used by the participants were rather divers, but could be divided into three major groups. The Soxhlet extraction with diethylether was considered to be the correct one as this technique to release the phthalates in plastic is also used in the only available standard test method EN14372. Also, it is a versitale method that is applicable on various types of plastics.

In the previous PT (February 2008) it was found that the influence of the sample preparation technique (Soxhlet extraction, THF dissolution or Ultrasonic extraction) is quite significant.

Also in this PT this effect was observed, but also that the type of plastic has a significant effect. In PVC sample #0913 the THF results were the highest of all results, while in pp sample #0914 the THF results were the lowest of all results. Also, the effects of the various extraction techniques appeared to be far less significant in pp sample #0914 than in PVC sample #0913. The spread of the EN14372 results is small in comparison with the spreads of the other results, but in several cases still large in comparison with the EN14372 requirements.

APPENDIX 3**Number of participating laboratories per country**

1 laboratory in AUSTRIA
1 laboratory in BANGLADESH
7 laboratories in FRANCE
12 laboratories in GERMANY
1 laboratory in GREECE
17 laboratories in HONG KONG
1 laboratory in HUNGARY
3 laboratories in INDIA
1 laboratory in INDONESIA
3 laboratories in ITALY
1 laboratory in JAPAN
3 laboratories in KOREA
1 laboratory in LATVIA
1 laboratory in MALAYSIA
1 laboratory in MEXICO
25 laboratories in P.R. of CHINA
1 laboratory in SINGAPORE
1 laboratory in SLOVENIA
1 laboratory in SPAIN
1 laboratory in SWITZERLAND
3 laboratories in TAIWAN R.O.C.
4 laboratories in THAILAND
2 laboratories in THE NETHERLANDS
4 laboratories in TURKEY
4 laboratories in U.S.A.
1 laboratory in UNITED KINGDOM
2 laboratories in VIETNAM

CORRECTED

APPENDIX 4**Abbreviations:**

C	= final result after checking of first reported suspect result
D(0.01)	= outlier in Dixon's outlier test
D(0.05)	= straggler in Dixon's outlier test
G(0.01)	= outlier in Grubbs' outlier test
G(0.05)	= straggler in Grubbs' outlier test
DG(0.01)	= outlier in Double Grubbs' outlier test
DG(0.05)	= straggler in Double Grubbs' outlier test
n.a.	= not applicable
nd	= not detected
