1 INTRODUCTION

Since 2013, the Institute for Interlaboratory Studies (iis) organizes a proficiency test (PT) for Vacuum Gasoil (VGO). During the annual proficiency testing program 2017/2018, it was decided to continue the round robin for the analysis of Vacuum Gasoil in accordance with the latest version of ISO8217.

In this interlaboratory study 77 laboratories from 33 different countries registered for participation. See appendix 2 for the number of participants per country. In this report, the results of the 2017 proficiency test are presented and discussed. This report is also electronically available through the iis website www.iisnl.com.

2 SETUP

The Institute for Interlaboratory Studies (iis) in Spijkenisse, the Netherlands, was the organiser of this proficiency test (PT). Sample analyses for fit-for-use and homogeneity testing were subcontracted to an ISO/IEC 17025 accredited laboratory. It was decided to send in this proficiency test one sample (1 litre bottle with VGO, labelled #17255) for various analyses. The participants were requested to report rounded and unrounded test results. The unrounded test results were preferably used for the statistical evaluation.

2.1 ACCREDITATION

The Institute for Interlaboratory Studies in Spijkenisse, the Netherlands, is accredited in agreement with ISO/IEC 17043:2010 (R007), since January 2000, by the Dutch Accreditation Council (Raad voor Accreditatie). This PT falls under the accredited scope. This ensures strict adherence to protocols for sample preparation and statistical evaluation and 100% confidentiality of participant's data. Feedback from the participants on the reported data is encouraged and customer's satisfaction is measured on regular basis by sending out questionnaires.

2.2 PROTOCOL

The protocol followed in the organisation of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' of March 2017 (iis-protocol, version 3.4). This protocol is electronically available through the iis website www.iisnl.com, from the FAQ page.

2.3 CONFIDENTIALITY STATEMENT

All data presented in this report must be regarded as confidential and for use by the participating companies only. Disclosure of the information in this report is only allowed by means of the entire report. Use of the contents of this report for third parties is only allowed by written permission of the Institute for Interlaboratory Studies. Disclosure of the identity of one or more of the participating companies will be done only after receipt of a written agreement of the companies involved.

2.4 SAMPLES

The necessary bulk material for sample #17255 was obtained from a local supplier. The approximately 110 litres bulk material was homogenised in a pre-cleaned drum. After homogenisation, 108 amber glass bottles of 1 litre were filled with Vacuum Gasoil (VGO) and labelled #17255. The homogeneity of the subsamples #17255 was checked by determination of Density in accordance with ISO12185 on 8 stratified randomly selected samples.

| | Density at 15 °C in kg/m ³ |
|-----------------|--|
| Sample #17255-1 | 923.1 |
| Sample #17255-2 | 923.0 |
| Sample #17255-3 | 923.1 |
| Sample #17255-4 | 923.1 |
| Sample #17255-5 | 923.0 |
| Sample #17255-6 | 923.0 |
| Sample #17255-7 | 923.1 |
| Sample #17255-8 | 923.1 |

Table 1: homogeneity test results of subsamples #17255

From the above test results, the repeatability was calculated and compared with 0.3 times the corresponding reproducibility of the reference test method in agreement with the procedure of ISO 13528, Annex B2 in the next table:

| | Density at 15 °C in kg/m ³ |
|---------------------------|--|
| r (observed) | 0.14 |
| Reference test method | ISO12185:96 |
| 0.3 x R(ref. test method) | 0.45 |

Table 2: evaluation of the repeatability of the subsamples #17255

The calculated repeatability was in agreement with 0.3 times the corresponding reproducibility of the reference test method. Therefore, homogeneity of the subsamples #17255 was assumed.

To each of the participating laboratories, one amber glass bottle of 1 litre (labelled #17255) was sent on November 22, 2017. A SDS was added to the package

2.5 STABILITY OF THE SAMPLES

The stability of Vacuum Gasoil (VGO), packed in an amber glass bottle, was checked. The material was found sufficiently stable for the period of the proficiency test.

2.6 ANALYSES

The participants were asked to determine on sample #17255: Acid Number (Total), Aniline Point, Asphaltenes, Carbon Residue (Micro method), Density at 15°C, Flash Point PMcc, Kinematic Viscosity at 50°C and at 100°C, Nitrogen, Pour Point (manual or automatic), Sulphur (Total), Metals (Arsenic, Calcium, Copper, Iron, Nickel, Silicon, Sodium, Vanadium), Simulated Distillation and Distillation (IBP, 10% rec, 30% rec, 50% rec, 70% rec, 90% rec and FBP).

It was explicitly requested to treat the samples as if they were routine samples and to report the test results using the indicated units on the report form and not to round the test results, but report as much significant figures as possible. It was also requested not to report 'less than' test results, which are above the detection limit, because such test results cannot be used for meaningful statistical calculations.

To get comparable test results, a detailed report form and a letter of instructions are prepared. On the report form the reporting units are given as well as the reference test methods that will be used during the evaluation. The detailed report form and the letter of instructions are both made available on the data entry portal www.kpmd.co.uk/sgs-iis/. The participating laboratories are also requested to confirm the sample receipt on this data entry portal. The letter of instructions can also be downloaded from the iis website www.iisnl.com.

3 RESULTS

During five weeks after sample dispatch, the test results of the individual laboratories were gathered via the data entry portal www.kpmd.co.uk/sgs-iis/. The reported test results are tabulated per determination in appendix 1 of this report. The laboratories are presented by their code numbers.

Directly after the deadline, a reminder was sent to those laboratories that had not reported test results at that moment.

Shortly after the deadline, the available test results were screened for suspect data. A test result was called suspect in case the Huber Elimination Rule (a robust outlier test) found it to be an outlier. The laboratories that produced these suspect data were asked to check the reported test results (no reanalysis). Additional or corrected test results are used for data analysis and the original test results are placed under 'Remarks' in the test result tables in appendix 1. Test results that came in after the deadline were not taken into account in this screening for suspect data and thus these participants were not requested for checks.

3.1 STATISTICS

The protocol followed in the organisation of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' of March 2017 (iis-protocol, version 3.4).

For the statistical evaluation, the *unrounded* (when available) figures were used instead of the rounded test results. Test results reported as '<...' or '>...' were not used in the statistical evaluation.

First, the normality of the distribution of the various data sets per determination was checked by means of the Lilliefors-test, a variant of the Kolmogorov-Smirnov test and by the calculation of skewness and kurtosis. Evaluation of the three normality indicators in combination with the visual evaluation of the graphic Kernel density plot, lead to judgement of the normality being either 'unknown', 'OK', 'suspect' or 'not OK'. After removal of outliers, this check was repeated. If a data set does not have a normal distribution, the (results of the) statistical evaluation should be used with due care.

According to ISO 5725 the original test results per determination were submitted to Dixon's and/or Grubbs' and/or Rosner's outlier tests. Outliers are marked by D(0.01) for the Dixon's test, by G(0.01) or DG(0.01) for the Grubbs' test and by R(0.01) for the Rosner's test.

Stragglers are marked by D(0.05) for the Dixon's test, by G(0.05) or DG(0.05) for the Grubbs' test and by R(0.05) for the Rosner's test. Both outliers and stragglers were not included in the calculations of averages and standard deviations.

For each assigned value, the uncertainty was determined in accordance with ISO13528. Subsequently the calculated uncertainty was evaluated against the respective requirement based on the target reproducibility in accordance with ISO13528. When the uncertainty passed the evaluation, no remarks are made in the report. However, when the uncertainty failed the evaluation it is mentioned in the report and it will have consequences for the evaluation of the test results.

Finally, the reproducibilities were calculated from the standard deviations by multiplying these with a factor of 2.8.

3.2 GRAPHICS

In order to visualize the data against the reproducibilities from literature, Gauss plots were made, using the sorted data for one determination (see appendix 1). On the Y-axis, the reported analysis results are plotted. The corresponding laboratory numbers are on the X-axis. The straight horizontal line presents the consensus value (a trimmed mean). The four striped lines, parallel to the consensus value line, are the +3s, +2s, -2s and -3s target reproducibility limits of the selected reference method. Outliers and other data, which were excluded from the calculations, are represented as a cross. Accepted data are represented as a triangle. Furthermore, Kernel Density Graphs were made. The Kernel Density Graph is a method for producing a smooth density approximation to a set of data that avoids some problems associated with histograms. Also, a normal Gauss curve was projected over the Kernel Density Graph for reference.

3.3 Z-SCORES

To evaluate the performance of the participating laboratories the z-scores were calculated. As it was decided to evaluate the performance of the participants in this proficiency test (PT) against the literature requirements, e.g. ASTM reproducibilities, the z-scores were calculated using a target standard deviation. This results in an evaluation independent of the variation in this interlaboratory study.

The target standard deviation was calculated from the literature reproducibility by division with 2.8. In case no literature reproducibility was available, other target values were used. In some cases, a reproducibility based on former iis proficiency tests could be used.

When a laboratory did use a test method with a reproducibility that is significantly different from the reproducibility of the reference test method used in this report, it is strongly advised to recalculate the z-score, while using the reproducibility of the actual test method used, this in order to evaluate whether the reported test result is fit-for-use.

The z-scores were calculated according to:

$$Z_{(\text{target})} = (\text{test result} - \text{average of PT}) / \text{target standard deviation}$$

The $Z_{(\text{target})}$ scores are listed in the result tables of appendix 1.

Absolute values for $z < 2$ are very common and absolute values for $z > 3$ are very rare. Therefore, the usual interpretation of z-scores is as follows:

| | |
|---------------|----------------|
| $ z < 1$ | good |
| $1 < z < 2$ | satisfactory |
| $2 < z < 3$ | questionable |
| $3 < z $ | unsatisfactory |

4 EVALUATION

In this proficiency test, some problems were encountered with the dispatch of the samples to laboratories in Malaysia and Russian Federation.

Three participants did not report any test results. Not all laboratories were able to report all requested parameters. In total 74 participants reported 1237 test results. Observed were 60 outlying test results, which is 4.9% of the numerical test results. In proficiency studies, outlier percentages of 3% - 7.5% are quite normal.

Not all original data sets proved to have a normal Gaussian distribution. These are referred to as "not OK" or "suspect". The statistical evaluation of these data sets should be used with due care, see also paragraph 3.1.

4.1 EVALUATION PER TEST

In this section, the reported test results are discussed per test. The test methods, which were used by the various laboratories were taken into account for explaining the observed differences when possible and applicable. These methods are also in the tables together with the original data. The abbreviations, used in these tables, are listed in appendix 3.

In the iis PT reports, ASTM methods are referred to with a number (e.g. D611) and an added designation for the year that the method was adopted or revised (e.g. D611:12). If applicable, a designation in parentheses is added to designate the year of reapproval (e.g. D611:12(2016)). In the results tables of Appendix 1 only the method number and year of adoption or revision e.g. D611:12 will be used.

Although VGO is an important feedstock for cracking installations, there are very few analytical standard methods specifically designed for the analysis of VGO. Most parameters are to be determined by using methods that are intended for residual fuel oil and blending components. Where applicable, precision data for Fuel Oil were used.

Acid Number (total): This determination was problematic for a number of laboratories. Four statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in agreement with the requirements of ASTM D664:17.

Aniline Point: This determination was very problematic. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is not at all in agreement with the requirements of ASTM D611:12(2016).

Asphaltenes: No significant conclusions were drawn because the precision data of IP143:04 are applicable to values between 0.50 %M/M and 30.0 %M/M. However, in comparison to the previous round robin (iis16G06), the reproducibility of the current PT is large.

Carbon Residue:
(Micro method) This determination was problematic for a number of laboratories. Six statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in full agreement with the requirements of ASTM D4530:15.

Density at 15°C: This determination was problematic for a number of laboratories. Four statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in full agreement with the requirements of ISO 12185:96.

Flash Point PMcc: This determination was not problematic. One statistical outlier was observed. However, the calculated reproducibility after rejection of the statistical outlier is in agreement with requirements of ASTM D93-B:16a.

Kin.Visco. at 50°C: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in good agreement with the requirements of ASTM D445:17a.

Kin.Visco.at 100°C: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in good agreement with the requirements of ASTM D445:17a.

Nitrogen: This determination was problematic. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is not in agreement with ASTM D5762:12.

Pour Point (Manual): This determination was not problematic. Four statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with ASTM D97:17a.

Pour Point (Automatic): This determination was not problematic. One statistical outlier was observed. However, the calculated reproducibility after rejection of the statistical outlier is in good agreement with ASTM D5950:14.

Sulphur (Total): This determination was problematic for a number of laboratories. Seven statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with the requirements of ASTM D4294:16e1.

Arsenic (As): All reported test results were near or below the application range of the used test methods. Therefore, no statistical conclusions were drawn

Calcium (Ca): This determination may be problematic at a level of 0.6 mg/kg. Four statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is not in agreement with the requirements of IP501:05.

Copper (Cu): All reported test results were near or below the application range of used test methods. Therefore, no statistical conclusions were drawn.

Iron (Fe): This determination was not problematic. One statistical outlier was observed. However, the calculated reproducibility after rejection of the statistical outlier is in good agreement with the requirements of IP621.16.

Nickel (Ni): This determination was problematic for a number of laboratories. Four statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in agreement with the requirements of IP621:16.

- Silicon (Si): All reported test results were near or below the application range of used test methods. Therefore, no statistical conclusions were drawn
- Sodium (Na): This determination was not problematic. One statistical outlier was observed. However, the calculated reproducibility after rejection of the statistical outlier is in agreement with the requirements of IP621:16.
- Vanadium (V): This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in good agreement with the requirements of IP621:16.
- Sim. Distillation The Simulated Distillation according to ASTM D6352:15 was problematic. In total seven statistical outliers were observed and three test results were excluded from statistical evaluation as the reported test results are correlated to the other reported test results.
Only the calculated reproducibility for Initial Boiling Point after rejection of the suspect data was in agreement with the requirements of ASTM D6352:15. For 10%, 30%, 50%, 70% and 90% recovered and Final Boiling Point the calculated reproducibility is not in agreement with the requirements of ASTM D6352:15.
- Distillation
Acc. D1160 The distillation according to ASTM D1160 was not problematic. In total eleven statistical outliers were observed and two test results were excluded as four of the six reported test results from one laboratory were statistical outliers. The test results are not independent from each other. However, for Initial Boiling Point, 10%, 30%, 50%, 70% and 90% recovery the calculated reproducibilities after rejection of the suspect data were in agreement with the requirements of ASTM D1160:15. Only for the Final Boiling Point the calculated reproducibility after rejection of the suspect data was not in agreement with the requirements of ASTM D1160:15.

4.2 PERFORMANCE EVALUATION FOR THE GROUP OF LABORATORIES

A comparison has been made between the reproducibility as declared by the relevant standard and the reproducibility as found for the group of participating laboratories that participated. The average results, calculated reproducibilities and target reproducibilities derived from literature standards (in casu ASTM and IP standards) or previous proficiency tests are compared in the next table.

| Parameter | unit | n | Average | 2.8 * sd | R(lit) |
|-------------------------------|----------|----|---------|----------|---------|
| Acid Number (Total) | mg KOH/g | 50 | 0.35 | 0.13 | 0.19 |
| Aniline Point | °C | 26 | 79.7 | 3.2 | 1.0 |
| Asphaltenes | %M/M | 28 | 0.28 | 0.22 | (0.06)* |
| Carbon Residue, micro method | %M/M | 50 | 1.02 | 0.19 | 0.19 |
| Density at 15 °C | kg/m³ | 63 | 923.3 | 1.5 | 1.5 |
| Flash Point PMcc | °C | 59 | 166.3 | 8.4 | 10 |
| Kinematic Viscosity at 50 °C | mm²/s | 68 | 39.466 | 0.870 | 3.339 |
| Kinematic Viscosity at 100 °C | mm²/s | 60 | 7.673 | 0.206 | 0.925 |
| Nitrogen | mg/kg | 41 | 1538 | 542 | 409 |
| Pour Point, manual | °C | 47 | 32.5 | 3.2 | 9 |
| Pour Point, automated, Δ3°C | °C | 19 | 32.0 | 3.8 | 6.1 |
| Sulphur Content (Total) | %M/M | 66 | 1.73 | 0.08 | 0.10 |
| Calcium (Ca) | mg/kg | 26 | 0.6 | 0.6 | 0.5 |
| Iron (Fe) | mg/kg | 50 | 3.0 | 2.7 | 3.5 |
| Nickel (Ni) | mg/kg | 47 | 2.1 | 1.0 | 2.4 |
| Sodium (Na) | mg/kg | 47 | 3.4 | 2.5 | 4.2 |
| Vanadium (V) | mg/kg | 47 | 7.6 | 1.5 | 3.5 |
| Simulated distillation D6352 | | | | | |
| - Initial Boiling Point | °C | 18 | 241.1 | 52.9 | 49.1 |
| - Temp 10% recovered | °C | 17 | 356.4 | 8.5 | 7.1 |
| - Temp 30% recovered | °C | 18 | 405.2 | 11.9 | 5.9 |
| - Temp 50% recovered | °C | 17 | 436.9 | 9.2 | 6.4 |
| - Temp 70% recovered | °C | 16 | 473.3 | 10.4 | 7.2 |
| - Temp 90% recovered | °C | 15 | 529.4 | 14.5 | 10.5 |
| - Final Boiling Point | °C | 16 | 638.9 | 125.3 | 38.1 |
| Distillation D1160 | | | | | |
| - Initial Boiling Point | °C | 35 | 243.4 | 50.5 | 49.5 |
| - Temp 10% recovered | °C | 38 | 376.3 | 14.2 | 18.9 |
| - Temp 30% recovered | °C | 39 | 413.9 | 9.8 | 11.5 |
| - Temp 50% recovered | °C | 39 | 442.9 | 7.8 | 11.1 |
| - Temp 70% recovered | °C | 38 | 475.2 | 8.7 | 9.9 |
| - Temp 90% recovered | °C | 36 | 529.2 | 13.4 | 22.3 |
| - Final Boiling Point | °C | 36 | 546.4 | 33.4 | 26.9 |

Table 3: reproducibilities of results of sample #17255

(*) results between brackets should be used with care, because the assigned value was below the application range

Without further statistical calculations it can be concluded that for a number of tests there is a good compliance of the group of participants with the relevant test methods. The tests that are problematic have been discussed in paragraph 4.1.

4.3 COMPARISON OF THE PROFICIENCY TEST OF DECEMBER 2017 WITH PREVIOUS PTS

| | December 2017 | December 2016 | December 2015 | December 2014 |
|----------------------------|---------------|---------------|---------------|---------------|
| Number of reporting labs | 74 | 73 | 54 | 51 |
| Number of results reported | 1275 | 1241 | 897 | 785 |
| Statistical outliers | 61 | 53 | 22 | 35 |
| Percentage outliers | 4.8% | 4.3% | 2.5% | 4.5% |

Table 4: comparison with previous proficiency tests.

In proficiency tests, outlier percentages of 3% - 7.5% are quite normal.

The performance of the determinations of the proficiency tests was compared against the requirements of the respective standards. The conclusions are given the following table:

| Determination | December 2017 | December 2016 | December 2015 | December 2014 |
|-------------------------------|---------------|---------------|---------------|---------------|
| Acid Number (Total) | + | ++ | + | + |
| Aniline Point | -- | - | -- | -- |
| Asphaltenes | (--)* | (--)* | (--)* | (--)* |
| Carbon Residue, micro method | +/- | - | +/- | -- |
| Density at 15 °C | +/- | +/- | +/- | +/- |

| Distillation D1160 | | | | |
| - Initial Boiling Point | +/- | -- | - | -- |
| - Temp 10% recovered | + | - | - | + |
| - Temp 30% recovered | + | - | + | +/- |
| - Temp 50% recovered | + | +/- | +/- | +/- |

| Determination | December 2017 | December 2016 | December 2015 | December 2014 |
|-----------------------|---------------|---------------|---------------|---------------|
| - Temp 70% recovered | + | - | - | - |
| - Temp 90% recovered | ++ | + | + | ++ |
| - Final Boiling Point | - | - | +/- | - |

Table 5: comparison determinations against the standard

(*) results between brackets should be used with care, because the assigned value was below the application range

The performance of the determinations against the requirements of the respective standards is listed in the above table. The following performance categories were used:

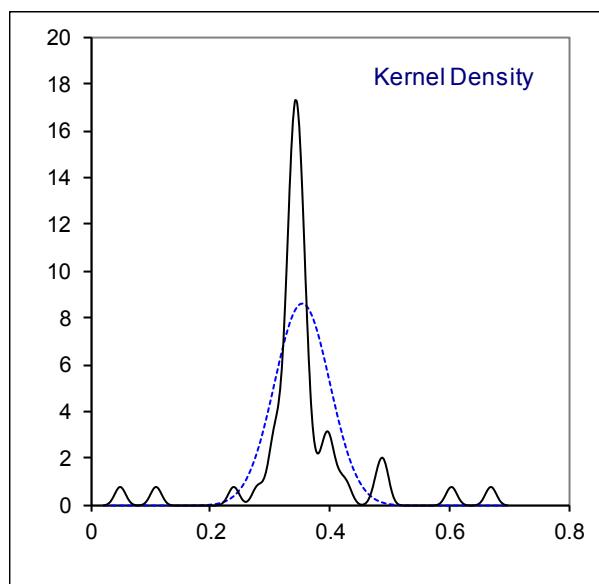

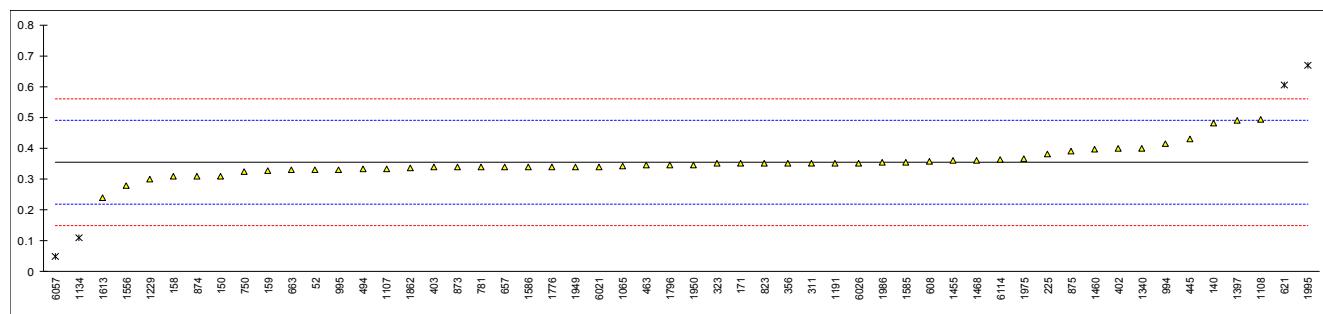

- ++: group performed much better than the standard
- + : group performed better than the standard
- +/-: group performance equals the standard
- : group performed worse than the standard
- : group performed much worse than the standard
- n.e.: not evaluated

APPENDIX 1

Determination of Acid Number (Total) on sample #17255; results in mg KOH/g

| lab | Method | value | mark | z(targ) | remarks |
|------|---------|-------|-----------|---------|---------------------|
| 52 | D664-A | 0.33 | | -0.36 | |
| 62 | | ---- | | ---- | |
| 120 | | ---- | | ---- | |
| 131 | | ---- | | ---- | |
| 140 | D664-A | 0.48 | | 1.84 | |

APPENDIX 2**Number of participants per country**

1 lab in AUSTRIA
1 lab in AZERBAIJAN
2 labs in BELGIUM
1 lab in BOSNIA and HERZEGOVINA
2 labs in CANADA
1 lab in COTE D'IVOIRE
1 lab in CROATIA
1 lab in DENMARK
1 lab in EGYPT
3 labs in FINLAND
3 labs in FRANCE
1 lab in GEORGIA
3 labs in GERMANY
2 labs in GREECE
1 lab in INDONESIA
1 lab in IRAQ
1 lab in ISRAEL
1 lab in JORDAN
2 labs in KAZAKHSTAN
1 lab in MALAYSIA
2 labs in MALTA
5 labs in NETHERLANDS
2 labs in ROMANIA
17 labs in RUSSIAN FEDERATION
1 lab in SAUDI ARABIA
1 lab in SINGAPORE
1 lab in SLOVAKIA
1 lab in SOUTH KOREA
3 labs in SWEDEN
1 lab in THAILAND
2 labs in UKRAINE
3 labs in UNITED KINGDOM
8 labs in UNITED STATES OF AMERICA

APPENDIX 3**Abbreviations**

| | |
|--------------|--|
| C | = final test result after checking of first reported suspect test result |
| D(0.01) | = outlier in Dixon's outlier test |
| D(0.05) | = straggler in Dixon's outlier test |
| G(0.01),G(1) | = outlier in Grubbs' outlier test |
| G(0.05),G(5) | = straggler in Grubbs' outlier test |
| DG(0.01) | = outlier in Double Grubbs' outlier test |
| DG(0.05) | = straggler in Double Grubbs' outlier test |
| R(0.01),R(1) | = outlier in Rosner's outlier test |
| R(0.05),R(5) | = straggler in Rosner's outlier test |
| E | = probably an error in calculations |
| U | = test result probably reported in a different unit |
| W | = test result withdrawn on request of participant |
| ex | = test result excluded from statistical evaluation |
| n.a. | = not applicable |
| n.e. | = not evaluated |
| n.d. | = not detected |
| fr. | = first reported |
| SDS | = safety data sheet |
