### 1 INTRODUCTION

Since 1995, the Institute for Interlaboratory Studies organizes a proficiency test for the analyses of ortho- and para-Xylenes once every two years. As part of the annual proficiency test program of 2018/2019, it was decided to continue this proficiency test on o- and p-Xylenes analyses according to the scope of the latest version of ASTM D5471 for o-Xylene and ASTM D5136 for p-Xylene.

In this interlaboratory study, 24 laboratories from 15 different countries did register for participation. See appendix 2 for the number of participants per country. In this report, the results of the proficiency test are presented and discussed. This report is also electronically available through the iis website www.iisnl.com.

## 2 SET UP

The Institute for Interlaboratory Studies (iis) in Spijkenisse, the Netherlands, was the organiser of this proficiency test (PT). Sample analyses for fit-for-use and homogeneity testing were subcontracted to an ISO/IEC 17025 accredited laboratory. It was decided to send one 0.25 L bottle with o-Xylene (labelled #18195) and one 0.5 L bottle with p-Xylene (labelled #18196). The participants were requested to report rounded and unrounded test results. The unrounded test results were preferably used for statistical evaluation.

### 2.1 ACCREDITATION

The Institute for Interlaboratory Studies in Spijkenisse, the Netherlands, is accredited in agreement with ISO/IEC 17043:2010 (R007), since January 2000, by the Dutch Accreditation Council (Raad voor Accreditatie). This proficiency test falls under the accredited scope. This ensures strict adherence to protocols for sample preparation and statistical evaluation and 100% confidentiality of participant's data. Feedback from the participants on the reported data is encouraged and customer's satisfaction is measured on regular basis by sending out questionnaires.

## 2.2 PROTOCOL

The protocol followed in the organisation of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' of June 2018 (iis-protocol, version 3.5). This protocol can be downloaded from the iis website www.iisnl.com, from the FAQ page.

### 2.3 CONFIDENTIALITY STATEMENT

All data presented in this report must be regarded as confidential and for use by the participating companies only. Disclosure of the information in this report is only allowed by means of the entire report. Use of the contents of this report for third parties is only allowed by written permission of the Institute for Interlaboratory Studies. Disclosure of the identity of one or more of the participating companies will be done only after receipt of a written agreement of the companies involved.

#### 2.4 SAMPLES

Two different samples were prepared; one for the analyses of o-Xylene and one for p-Xylene. A batch of approximately 10 litre of o-Xylene was purchased from a local supplier of chemicals. After homogenisation, 48 amber glass bottles were filled with approx. 0.25L o-Xylene and labelled #18195. The homogeneity of the subsamples of #18195 was checked by the determination of Density at 20°C in accordance with ASTM D4052 and by the determination of p-Xylene in accordance with ASTM D3797 on 8 stratified randomly selected samples.

	Density at 20°C in kg/L	p-Xylene in %M/Mt
sample #18195-1	0.87964	0.086
sample #18195-2	0.87966	0.087
sample #18195-3	0.87966	0.087
sample #18195-4	0.87966	0.086
sample #18195-5	0.87965	0.086
sample #18195-6	0.87966	0.088
sample #18195-7	0.87966	0.087
sample #18195-8	0.87965	0.088

Table 1: homogeneity test results of subsamples #18195 (o-Xylene)

From the above test results, the repeatabilities were calculated and compared with 0.3 times the corresponding reproducibilities of the reference test methods in agreement with the procedure of ISO 13528, Annex B2 in the next table:

	Density at 20°C in kg/L	p-Xylene in %M/M
r (observed)	0.00002	0.002
reference test method	ISO12185:96	ASTM D3797:05
0.3 * R (ref. test method)	0.00015	0.009

Table 2: repeatabilities on subsamples #18195

A batch of approximately 25 litre p-Xylene was purchased from a local supplier of chemicals. After homogenisation, 47 amber glass bottles were filled with approx. 0.5L p-Xylene and labelled #18196. The homogeneity of the subsamples was checked by the determination of Density at 20°C in accordance with ASTM D4052 and by the determination of o-Xylene in accordance with ASTM D3798 on 8 stratified randomly selected samples.

	Density at 20°C in kg/L	o-Xylene in %M/M
sample #18196-1	0.86098	0.042
sample #18196-2	0.86098	0.043
sample #18196-3	0.86097	0.043
sample #18196-4	0.86097	0.042
sample #18196-5	0.86097	0.042
sample #18196-6	0.86097	0.041
sample #18196-7	0.86098	0.042
sample #18196-8	0.86098	0.040

Table 3: homogeneity test results of subsamples #18196 (p-Xylene)

From the above test results, the repeatabilities were calculated and compared with 0.3 times the corresponding reproducibilities of the reference test methods in agreement with the procedure of ISO 13528, Annex B2 in the next table:

	Density at 20°C in kg/L	o-Xylene in %M/M
r (observed)	0.00001	0.003
reference test method	ISO12185:96	ASTM D5917:15e1
0.3 * R (ref. test method)	0.00015	0.016

Table 4: repeatabilities on subsamples #18196

All observed repeatabilities (see tables 2 and 4) were less than 0.3 times the corresponding reproducibilities of the reference test methods. Therefore, homogeneities of the subsamples #18195 and #18196 were assumed.

To each of the participating laboratories 1 bottle of 0.25 L with o-Xylene (labelled #18195) and 1 bottle of 0.5 L with p-Xylene (labelled #18196) were sent on September 19, 2018.

### 2.5 STABILITY OF THE SAMPLES

The stability of o-Xylene and p-Xylene, packed in the amber glass bottles of 0.25 L and 0.5 L was checked. The material was found sufficiently stable for the period of the proficiency test.

### 2.6 ANALYSES

The participants were requested to determine on sample #18195 (o-Xylene); Purity and Impurities (m- and p-Xylene, Ethylbenzene, n-Propylbenzene, iso-Propylbenzene (Cumene), Styrene, Sum of Ethyltoluenes, Toluene, C9 and heavier aromatics and Nonaromatics. On sample #18196 (p-Xylene) was requested to determine; Appearance, Organic Chloride, Color Pt/Co, Density at 20°C, Distillation (Initial Boiling Point (IBP), 50% Distillation Point, Dry Point (DP) and Distillation Range (DR)), Sulphur, Purity and Impurities (o- and m-Xylene, Ethylbenzene, Styrene, Toluene, Nonaromatics).

It was explicitly requested to treat the samples as if they were routine samples and to report the test results using the indicated units on the report form and not to round the test results, but report as much significant figures as possible. It was also requested not to report 'less than' results, which are above the detection limit, because such results cannot be used for meaningful statistical evaluations.

To get comparable test results, a detailed report form and a letter of instructions are prepared. On the report form the reporting units are given as well as the reference test methods that will be used during the evaluation. The detailed report form and the letter of instructions are both made available on the data entry portal www.kpmd.co.uk/sgs-iis/. The participating laboratories are also requested to confirm the sample receipt on this data entry portal. The letter of instructions can also be downloaded from the iis website www.iisnl.com.

### 3 RESULTS

During five weeks after sample dispatch, the test results of the individual laboratories were gathered via the data entry portal www.kpmd.co.uk/sgs-iis/. The reported test results are tabulated per determination in appendix 1 of this report. The laboratories are presented by their code numbers.

Directly after the deadline, a reminder was sent to those laboratories that had not reported test results at that moment. Shortly after the deadline, the available test results were screened for suspect data. A test result was called suspect in case the Huber Elimination Rule (a robust outlier test) found it to be an outlier. The laboratories that produced these suspect data were asked to check the reported test results (no reanalysis). Additional or corrected test results are used for data analysis and original test results are placed under 'Remarks' in the test result tables in appendix 1. Test results that came in after the deadline were not taken into account in this screening for suspect data and thus these participants were not requested for checks.

### 3.1 STATISTICS

The protocol followed in the organization of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' of June 2018 (iis-protocol, version 3.5).

For the statistical evaluation the *unrounded* (when available) figures were used instead of the rounded test results. Test results reported as '<...' or '>...' were not used in the statistical evaluation.

First, the normality of the distribution of the various data sets per determination was checked by means of the Lilliefors-test a variant of the Kolmogorov-Smirnov test and by the calculation of skewness and kurtosis. Evaluation of the three normality indicators in combination with the visual evaluation of the graphic Kernel density plot, lead to judgement of the normality being either 'unknown', 'OK', 'suspect' or 'not OK'. After removal of outliers, this check was repeated. If a data set does not have a normal distribution, the (results of the) statistical evaluation should be used with due care.

According to ISO 5725 the original test results per determination were submitted to Dixon's, Grubbs' and/or Rosner's outlier tests. Outliers are marked by D(0.01) for the Dixon's test, by G(0.01) or DG(0.01) for the Grubbs' test and by R(0.01) for the Rosner's test. Stragglers are marked by D(0.05) for the Dixon's test, by G(0.05) or DG(0.05) for the Grubbs' test and by R(0.05) for the Rosner's test. Both outliers and stragglers were not included in the calculations of averages and standard deviations.

For each assigned value, the uncertainty was determined in accordance with ISO13528. Subsequently the calculated uncertainty was evaluated against the respective requirement based on the target reproducibility in accordance with ISO13528. In this PT, the criterion of ISO13528, paragraph 9.2.1. was met for all evaluated tests, therefore, the uncertainty of all assigned values may be negligible and need not be included in the PT report.

Finally, the reproducibilities were calculated from the standard deviations by multiplying them with a factor of 2.8.

### 3.2 GRAPHICS

In order to visualize the data against the reproducibilities from literature, Gauss plots were made, using the sorted data for one determination (see appendix 1). On the Y-axis the reported test results are plotted. The corresponding laboratory numbers are on the X-axis. The straight horizontal line presents the consensus value (a trimmed mean). The four striped lines, parallel to the consensus value line, are the +3s, +2s, -2s and -3s target reproducibility limits of the selected reference test method. Outliers and other data, which were excluded from the calculations, are represented as a cross. Accepted data are represented as a triangle.

Furthermore, Kernel Density Graphs were made. This is a method for producing a smooth density approximation to a set of data that avoids some problems associated with histograms. Also, a normal Gauss curve was projected over the Kernel Density Graph for reference.

### 3.3 Z-SCORES

To evaluate the performance of the participating laboratories the z-scores were calculated. As it was decided to evaluate the performance of the participants in this proficiency test (PT) against the literature requirements, e.g. ASTM reproducibilities, the z-scores were calculated using a target standard deviation. This results in an evaluation independent of the variation of this interlaboratory study. The target standard deviation was calculated from the literature reproducibility by division with 2.8. In case no literature reproducibility was available, other target values were used. In some cases, a reproducibility based on former iis proficiency tests could be used.

When a laboratory did use a test method with a reproducibility that is significantly different from the reproducibility of the reference test method used in this report, it is strongly advised to recalculate the z-score, while using the reproducibility of the actual test method used, this in order to evaluate whether the reported test result is fit-for-use.

The z-scores were calculated according to:

```
z_{\text{(target)}} = \text{(test result - average of PT)} / \text{target standard deviation}
```

The  $z_{(target)}$  scores are listed in the test result tables in appendix 1. Absolute values for z<2 are very common and absolute values for z>3 are very rare. The usual interpretation of z-scores is as follows:

```
|z| < 1 good

1 < |z| < 2 satisfactory

2 < |z| < 3 questionable

3 < |z| unsatisfactory
```

#### 4 **EVALUATION**

In this proficiency test some problems were encountered with the dispatch of the samples to the laboratories. A number of laboratories received the samples late due to custom clearance problems. One participant received a bottle which was broken. A new one was sent.

One participant did not report any test results and two other participants did report test results after the final reporting date. Not all participants were able to report all requested parameters. Finally, 23 participants did report 375 numerical test results. Observed were 16 outlying test results, which is 4.3%. In proficiency studies, outlier percentages of 3% - 7.5% are quite normal.

Not all original data sets proved to have a normal Gaussian distribution. These are referred to as "not OK" or "suspect". The statistical evaluation of these data sets should be used with due care.

### 4.1 EVALUATION PER SAMPLE AND PER TEST

In this section, the results are discussed per sample and per test.

The reference test methods for the analyses of o- and p-Xylenes were selected according to the scope of the latest version of ASTM D5471:18 for o-Xylene and ASTM D5136:17a for p-Xylene. Regretfully, the precision data mentioned in ASTM D7504 is very strict. It was therefore decided to use to precision data mentioned in ASTM D397:05, which was withdrawn. In case no precision data was mentioned, the calculated reproducibility was compared against the estimated requirements based on the Horwitz equation.

## Sample #18195 o-Xylene:

<u>Purity</u>: This determination was not problematic. One statistical outlier was observed.

However, the calculated reproducibility after rejection of the statistical outlier

is in good agreement with the requirements of ASTM D3797:05.

m-Xylene: This determination was not problematic. No statistical outliers were observed

and the calculated reproducibility is in good agreement with the requirements

of ASTM D3797:05.

<u>p-Xylene</u>: This determination was not problematic. One statistical outlier was observed.

The calculated reproducibility after rejection of the statistical outlier is in full

agreement with the requirements of ASTM D3797:05.

<u>Ethylbenzene</u>: This determination was not problematic. Two statistical outliers were

observed. However, the calculated reproducibility after rejection of the

statistical outliers is in agreement with the requirements of ASTM D3797:05.

<u>n-Propylbenzene</u>: This determination was not problematic. One statistical outlier was

observed. The calculated reproducibility after rejection of the statistical outlier is not in agreement with the strict requirements estimated using the

Horwitz equation.

iso-Propylbenzene: This determination was not problematic. Two statistical outliers were

observed. The calculated reproducibility after rejection of the statistical outliers is in agreement with the requirements of ASTM D3797:05.

Styrene: This determination was not problematic. No statistical outliers were

observed. The calculated reproducibility is in good agreement with the

requirements of ASTM D3797:05.

<u>Sum of Ethyltoluenes:</u> This determination may be problematic. No statistical outliers were

observed. However, the calculated reproducibility is not in agreement with the strict requirements estimated using the Horwitz equation (based on 3

components).

<u>Toluene</u>: Almost all reporting participants reported a test result below 0.001.

Therefore, no z-scores were calculated.

C9 and heavier aromatics: This determination was not problematic. One statistical outlier was

observed. However, the calculated reproducibility after rejection of the statistical outlier is in good agreement with the requirements of ASTM

D7504:18.

Nonaromatics: This determination was not problematic. No statistical outliers were

observed. The calculated reproducibility is in good agreement with the

requirements of ASTM D3797:05.

## Sample #18196 p-Xylene:

<u>Appearance</u>: All participants agreed about the appearance of sample #18196. Participants

who used the ASTM E2680 should report the Appearance as 'pass' (or 'fail'). Nine participants reported the appearance correctly as pass. The other laboratories used different kind of terms or abbreviations like: Clear, Clear

and Bright or Clear and Free from Suspended Matter.

Organic chloride: This determination was not problematic. No statistical outliers were

observed. The calculated reproducibility is in good agreement with the

requirements of ASTM D5808:18.

<u>Color Pt/Co</u>: This determination was not problematic. No statistical outliers were

observed. The calculated reproducibility is in agreement with the requirements of ASTM D5386:16 and ASTM D1209:05(2011).

Density: This determination was not problematic. One statistical outlier was observed.

The calculated reproducibility after rejection of the statistical outlier is in good

agreement with the requirements of ISO12185:96.

<u>Distillation</u>: This determination was not problematic. No statistical outliers were observed.

The calculated reproducibilities of IBP, 50% rec, DP and distillation range are

in agreement with the requirements of ASTM D850-A:18.

<u>Sulphur</u>: This determination was problematic depending on the test method used. No

statistical outliers were observed. However, the calculated reproducibility is

not in agreement with the requirements of ASTM D7183:16, but is in

agreement with the requirements of ASTM D5453:16e1.

<u>Purity</u>: This determination was problematic. One statistical outlier was observed.

The calculated reproducibility after rejection of the statistical outlier is not in

agreement with the requirements of ASTM D5917:15e1.

<u>o-Xylene</u>: This determination was not problematic. One statistical outlier was observed.

However, the calculated reproducibility after rejection of the statistical outlier

is in good agreement with the requirements of ASTM D5917:15e1.

<u>m-Xylene</u>: This determination was problematic. One statistical outlier was observed.

The calculated reproducibility after rejection of the statistical outlier is not in

agreement with the requirements of ASTM D5917:15e1.

Ethylbenzene: This determination was not problematic. Two statistical outliers were

observed. However, the calculated reproducibility after rejection of the

statistical outliers is in agreement with the requirements of ASTM

D5917:15e1.

Styrene: All participants reported a test result below 0.001. Therefore, no z-scores

were calculated.

Toluene: This determination was not problematic. One statistical outlier was observed.

However, the calculated reproducibility after rejection of the statistical outlier

is in good agreement with the requirements of ASTM D5917:15e1.

Nonaromatics: This determination was not problematic. One statistical outlier was observed.

The calculated reproducibility after rejection of the statistical outlier is in

agreement with the requirements of ASTM D5917:15e1.

#### 4.2 Performance evaluation for the group of Laboratories

A comparison has been made between the reproducibility as declared by the relevant reference test method and the reproducibility as found for the group of participating laboratories. The average results per sample, calculated reproducibilities and reproducibilities derived from reference test methods (in casu ASTM test methods), are compared in the next tables.

Parameter	unit	n	average	2.8 * sd	R (lit)
Purity (o-Xylene)	%M/M	16	98.967	0.151	0.423
m-Xylene	%M/M	16	0.386	0.031	0.094
p-Xylene	%M/M	15	0.087	0.008	0.030
Ethylbenzene	%M/M	11	0.0009	0.0003	0.0004
n-Propylbenzene	%M/M	9	0.026	0.003	0.005
i-Propylbenzene (Cumene)	%M/M	15	0.305	0.025	0.079
Styrene	%M/M	13	0.0062	0.0015	0.0025
Sum of Ethyltoluenes	%M/M	6	0.039	0.015	0.012
Toluene	%M/M	10	<0.001	n.a.	n.a.
C9 and heavier aromatics	%M/M	12	0.375	0.044	1.164
Non-aromatics	%M/M	17	0.181	0.051	0.134

Table 5: reproducibilities for sample #18195 (o-Xylene)

Parameter	unit	n	average	2.8 * sd	R(lit)
Appearance		18	Pass	n.a.	n.a.
Organic Chloride	mg/kg	12	0.73	0.60	1.3
Color Pt/Co		17	4.2	3.8	5.3
Density at 20°C	kg/L	16	0.8610	0.0001	0.0005
Initial Boiling Point	°C	14	137.8	0.6	1.0
50% Boiling Point	°C	15	138.3	0.3	0.4
Dry Point	°C	14	138.4	0.4	0.4
Distillation Range	°C	13	0.5	0.6	1.1
Sulphur	mg/kg	9	0.26	0.22	0.18
Purity (p-Xylene)	%M/M	21	99.705	0.074	0.042
o-Xylene	%M/M	20	0.044	0.007	0.056
m-Xylene	%M/M	20	0.153	0.055	0.050
Ethylbenzene	%M/M	19	0.077	0.013	0.016
Styrene	%M/M	8	<0.001	n.a.	n.a.
Toluene	%M/M	20	0.0058	0.0010	0.0026
Non-aromatics	%M/M	19	0.0107	0.0060	0.0244

Table 6: reproducibilities for sample #18196 (p-Xylene)

Without further statistical calculations, it can be concluded that for most tests there is a good compliance of the group of participating laboratories with the relevant reference test method. The problematic tests have been discussed in paragraph 4.1.

## 4.3 COMPARISON OF THE OCTOBER 2018 PROFICIENCY TEST WITH PREVIOUS PT RESULTS

	October 2018	October 2016	October 2014	September 2012	October 2010
Number of reporting labs	23	26	29	27	26
Number of test results	375	498	529	471	471
Statistical outliers	16	16	29	27	41
Percentage outliers	4.3%	3.2%	5.5%	5.7%	8.7%

Table 7: comparison with previous proficiency tests

In proficiency tests, outlier percentages of 3% - 7.5% are quite normal.

The performance of the determinations of the proficiency tests was compared against the requirements of the respective reference test methods. The conclusions are given the following table:

Parameter	October 2018	October 2016	October 2014	September 2012	October 2010
Purity (o-Xylene)	++	+	++	+	++
m-Xylene	++	+	++	++	++
p-Xylene	++	+/-	++	++	++
Ethylbenzene	+	+	++	++	++
n-Propylbenzene	+	-	+/-	++	-
i-Propylbenzene (Cumene)	++	Ī	+	++	++
Styrene	+	+	+	++	++
Sum of Ethyltoluenes	-	Ī	+	+/-	1
Toluene	n.e.	+/-	+/-	++	++
C9 and heavier aromatics	++	++	n.e.	n.e.	n.e.
Non-aromatics	++	+/-	++	++	++

Table 8: comparison determinations of sample #18195 (o-Xylene) against the reference test methods

Parameter	October 2018	October 2016	October 2014	September 2012	October 2010
Organic Chloride	++	++	++	n.e	n.e.
Color Pt/Co	+	-	++	+	
Density at 20°C	++	++	++	++	++

50% Boiling Point	+	+	++	+/-	+/-
Dry Point	+/-	+/-	++	-	++
Distillation Range	++	++	n.e.	n.e	n.e.
Sulphur	-	-	+/-	n.e.	()
Purity (p-Xylene)	-	+/-	++	-	++
o-Xylene	++	++	++	++	++
m-Xylene	-	+	+	-	
Ethylbenzene	+	+	++	++	++
Styrene	n.e.	+/-	++	-	n.e.
Toluene	++	+	++	++	++
Non-aromatics	++	++	++	++	++

Table 9: comparison determinations of sample #18196 (p-Xylene) against the reference test methods

NB Marks between brackets should be used with care as the consensus value was outside the application range of the test method

The performance of the determinations against the requirements of the respective reference test methods is listed in the above table. The following performance categories were used:

++: group performed much better than the reference test method

+ : group performed better than the reference test method

+/-: group performance equals the reference test method

- : group performed worse than the reference test method

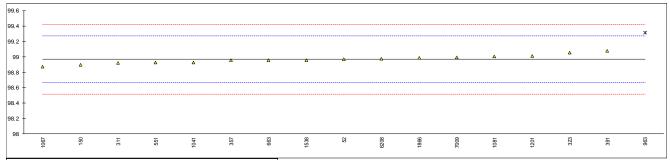

--: group performed much worse than the reference test method

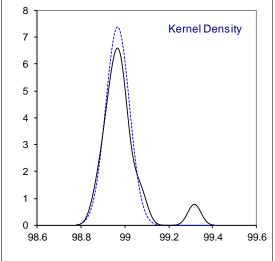

n.e.: not evaluated

## **APPENDIX 1**

Determination of Purity of o-Xylene sample #18195; results in %M/M.

## **APPENDIX 2**

## List of number of participants per country

- 1 lab in BELGIUM
- 2 labs in BRAZIL
- 1 lab in CANADA
- 1 lab in FINLAND
- 1 lab in GERMANY
- 2 labs in INDIA
- 1 lab in IRAN, Islamic Republic of
- 1 lab in ITALY
- 2 labs in KUWAIT
- 4 labs in NETHERLANDS
- 1 lab in POLAND
- 3 labs in SAUDI ARABIA
- 1 lab in SOUTH KOREA
- 1 lab in THAILAND
- 2 labs in UNITED STATES OF AMERICA

### **APPENDIX 3**

#### Abbreviations:

C = final test result after checking of first reported suspect test result

 $\begin{array}{ll} D(0.01) &= \text{outlier in Dixon's outlier test} \\ D(0.05) &= \text{straggler in Dixon's outlier test} \\ G(0.01) &= \text{outlier in Grubbs' outlier test} \\ G(0.05) &= \text{straggler in Grubbs' outlier test} \\ DG(0.01) &= \text{outlier in Double Grubbs' outlier test} \end{array}$ 

DG(0.05) = straggler in Double Grubbs' outlier test

R(0.01) = outlier in Rosner's outlier test R(0.05) = straggler in Rosner's outlier test E = probably an error in calculations

U = test result probably reported in a different unit
W = test result withdrawn on request of participant
ex = test result excluded from statistical evaluations

n.a. = not applicable
n.e. = not evaluated
n.d. = not detected
fr. = first reported
SDS = Safety Data Sheet
