## **1 INTRODUCTION**

Since 2007 the Institute for Interlaboratory Studies organizes a proficiency test for the analyses on Dissolved Gas Analysis (DGA) in Transformer Oil every year. During the annual proficiency testing program 2018/2019, it was decided to continue the round robin for the analyses on Dissolved Gas Analysis (DGA) in Transformer Oil. In this interlaboratory study on DGA in Transformer Oil, 60 laboratories from 31 different countries did register for participation. See appendix 3 for the number of participants per country. In this report the results of the 2018 interlaboratory study on Dissolved Gas Analysis (DGA) in Transformer Oil are presented and discussed. This report is also electronically available through the iis website [www.iisnl.com](http://www.iisnl.com).

## **2 SET UP**

The Institute for Interlaboratory Studies (iis) in Spijkenisse, the Netherlands, was the organiser of this proficiency test (PT). In total one batch of 65 certified syringes was prepared with lot code RN334. The syringes were prepared in two different volumes: 50mL and 100mL. The syringes (True North) were provided by Morgan Schaffer Inc, Quebec, Canada. Each syringe was uniquely numbered and labelled #18234. It was decided to send to each participating laboratory one syringe (50 or 100 mL) without the Morgan Schaffer certificate. Participants were requested to report rounded and unrounded test results. The unrounded test results were preferably used for statistical evaluation.

### **2.1 ACCREDITATION**

The Institute for Interlaboratory Studies in Spijkenisse, the Netherlands, is accredited in agreement with ISO/IEC 17043:2010 (R007), since January 2000, by the Dutch Accreditation Council (Raad voor Accreditatie). This PT falls under the accredited scope. This ensures strict adherence to protocols for sample preparation and statistical evaluation and 100% confidentiality of participant's data. Feedback from the participants on the reported data is encouraged and customer's satisfaction is measured on regular basis by sending out questionnaires.

Morgan Schaffer Inc. is ISO 9001 certified and ISO/IEC17025 accredited by ANSI-ASQ.

### **2.2 PROTOCOL**

The protocol followed in the organization of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organization, Statistics and Evaluation' of June 2018 (iis-protocol, version 3.5). This protocol can be downloaded from the iis website [www.iisnl.com](http://www.iisnl.com), from the FAQ page.

### **2.3 CONFIDENTIALITY STATEMENT**

All data presented in this report must be regarded as confidential and for use by the participating companies only. Disclosure of the information in this report is only allowed by means of the entire report. Use of the contents of this report for third parties is only allowed by written permission of the Institute for Interlaboratory Studies. Disclosure of the identity of one or more of the participating companies will be done only after receipt of a written agreement of the companies involved.

### **2.4 SAMPLES**

In this proficiency test one type of Transformer Oil was used for the preparation of the gas tight syringes of 50mL or 100mL. These syringes were subsequently tested by Morgan Schaffer Inc. (Quebec, Canada) in accordance with ASTM Method D3612 and IEC 60567. In total one batch of 65 syringes (30x50mL and 35x100mL) was prepared (lot code RN334). Each syringe was labelled #18234.

The repeatabilities are in agreement for all components with 0.3 times the corresponding reproducibility of the target test method according with the procedure of ISO13528. Therefore, homogeneity of the subsamples #18234 was assumed.

Depending on the registration to each of the participating laboratories a syringe of 50mL or a syringe of 100mL, both labelled #18234, was sent on October 31, 2018. An SDS was added to the sample package.

### **2.5 STABILITY OF THE SAMPLES**

Morgan Schaffer declares that bulk storage prior to shipping has a shelf life of at least 6 months. This was assumed to be sufficient for the period of the proficiency test.

### **2.6 ANALYSES**

The participants were requested to determine on sample #18234: Hydrogen, Oxygen, Nitrogen, Carbon Monoxide, Carbon Dioxide, Methane, Ethane, Ethene, Ethyn, Propane and Propene. Also, some analytical details were requested.

It was explicitly requested to treat the sample as if it was a routine sample and to report the test results using the indicated units on the report form and not to round the test results, but report as much significant figures as possible. It was also requested not to report 'less than' test results, which are above the detection limit, because such test results cannot be used for meaningful statistical evaluations.

To get comparable test results, a detailed report form and a letter of instructions are prepared. On the report form the reporting units are given as well as the appropriate reference test methods that will be used during the evaluation. The detailed report form and the letter of instructions are both made available on the data entry portal [www.kpmd.co.uk/sgs-iis/](http://www.kpmd.co.uk/sgs-iis/). The participating laboratories are also requested to confirm the sample receipt on this data entry portal. The letter of instructions can also be downloaded from the iis website [www.iisnl.com](http://www.iisnl.com).

### 3 RESULTS

During five weeks after sample dispatch, the test results of the individual laboratories were gathered via the data entry portal [www.kpmd.co.uk/sgs-iis/](http://www.kpmd.co.uk/sgs-iis/). The reported test results are tabulated per determination in appendix 1 of this report. The laboratories are presented by their code numbers.

Directly after the deadline a reminder was sent to those laboratories that had not reported test results at that moment. Shortly after the deadline, the available test results were screened for suspect data. A test result was called suspect in case the Huber Elimination Rule (a robust outlier test) found it to be an outlier. The laboratories that produced these suspect data were asked to check the reported test results (no reanalysis). Additional or corrected test results are used for data analysis and the original test results are placed under 'Remarks' in the test result tables in appendix 1. Test results that came in after the deadline were not taken into account in this screening for suspect data and thus these participants were not requested for checks.

#### 3.1 STATISTICS

The protocol followed in the organisation of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' of June 2018 (iis-protocol, version 3.5).

For the statistical evaluation, the *unrounded* (when available) figures were used instead of the rounded test results. Test results reported as '<... ' or '>... ' were not used in the statistical evaluation.

First, the normality of the distribution of the various data sets per determination was checked by means of the Lilliefors-test, a variant of the Kolmogorov-Smirnov test and by the calculation of skewness and kurtosis. Evaluation of the three normality indicators in combination with the visual evaluation of the graphic Kernel density plot, lead to judgement of the normality being either 'unknown', 'OK', 'suspect' or 'not OK'. After removal of outliers, this check was repeated. If a data set does not have a normal distribution, the (results of the) statistical evaluation should be used with due care.

According to ISO5725 the original test results per determination were submitted to Dixon's, Grubbs' and/or Rosner's outlier tests. Outliers are marked by D(0.01) for the Dixon's test, by G(0.01) or DG(0.01) for the Grubbs' test and by R(0.01) for the Rosner's test. Stragglers are marked by D(0.05) for the Dixon's test, by G(0.05) or DG(0.05) for the Grubbs' test and by R(0.05) for the Rosner's test. Both outliers and stragglers were not included in the calculations of averages and standard deviations.

For each assigned value, the uncertainty was determined in accordance with ISO13528. Subsequently the calculated uncertainty was evaluated against the respective requirement based on the target reproducibility in accordance with ISO13528. In this PT, the criterion of ISO13528, paragraph 9.2.1. was met for all evaluated tests, therefore, the uncertainty of all assigned values may be negligible and need not be included in the PT report.

Finally, the reproducibilities were calculated from the standard deviations by multiplying these with a factor of 2.8.

### 3.2 GRAPHICS

In order to visualize the data against the reproducibilities from literature, Gauss plots were made, using the sorted data for one determination (see appendix 1). On the Y-axis, the reported analysis results are plotted. The corresponding laboratory numbers are on the X-axis. The straight horizontal line presents the consensus value (a trimmed mean). The four striped lines, parallel to the consensus value line, are the +3s, +2s, -2s and -3s target reproducibility limits of the selected reference test method. Outliers and other data, which were excluded from the calculations, are represented as a cross. Accepted data are represented as a triangle. Furthermore, Kernel Density Graphs were made. The Kernel Density Graph is a method for producing a smooth density approximation to a set of data that avoids some problems associated with histograms. Also, a normal Gauss curve was projected over the Kernel Density Graph for reference.

### 3.3 Z-SCORES

To evaluate the performance of the participating laboratories the z-scores were calculated. As it was decided to evaluate the performance of the participants in this proficiency test (PT) against the literature requirements, e.g. ASTM reproducibilities, the z-scores were calculated using a target standard deviation. This results in an evaluation independent of the variation in this interlaboratory study.

The target standard deviation was calculated from the literature reproducibility by division with 2.8. In case no literature reproducibility was available, other target values were used. In some cases, a reproducibility based on former iis proficiency tests could be used.

When a laboratory did use a test method with a reproducibility that is significantly different from the reproducibility of the reference test method used in this report, it is strongly advised to recalculate the z-score, while using the reproducibility of the actual test method used, this in order to evaluate whether the reported test result is fit-for-use.

The z-scores were calculated according to:

$$z_{(\text{target})} = (\text{test result} - \text{average of PT}) / \text{target standard deviation}$$

The  $z_{(\text{target})}$  scores are listed in the result tables of appendix 1.

Absolute values for  $z < 2$  are very common and absolute values for  $z > 3$  are very rare. Therefore, the usual interpretation of z-scores is as follows:

|               |                |
|---------------|----------------|
| $ z  < 1$     | good           |
| $1 <  z  < 2$ | satisfactory   |
| $2 <  z  < 3$ | questionable   |
| $3 <  z $     | unsatisfactory |

## 4 EVALUATION

In this proficiency test, no major problems were encountered with the dispatch of the samples. Seven participants did not report any test results at all. Not all participants were able to report all requested components. Finally, 53 participants reported 496 numerical test results. Observed were 25 outlying test results, which is 5.0% of the numerical test results. In proficiency studies, outlier percentages of 3% - 7.5% are quite normal.

Not all original data sets proved to have a normal Gaussian distribution. These are referred to as “not OK” or “suspect”. The statistical evaluation of these data sets should be used with due care, see also paragraph 3.1.

### 4.1 EVALUATION PER COMPONENT

In this section the reported test results are discussed per component. The test methods, which were used by the various laboratories were taken into account for explaining the observed differences when possible and applicable. These methods are also in the tables together with the original data. The abbreviations, used in these tables, are listed in appendix 4.

#### **Sample #18234**

Hydrogen: The determination of this component was problematic. Three statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is not in agreement with the strict requirements of IEC 60567:2011.

Oxygen: The determination of this component was problematic for a number of laboratories. Six statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in agreement with the requirements of IEC 60567:2011.

Nitrogen: The determination of this component was problematic. Two statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is not in agreement with the requirements of IEC 60567:2011.

- Carbon Monoxide: The determination of this component was problematic. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is not in agreement with the requirements of IEC 60567:2011.
- Carbon Dioxide: The determination of this component was problematic. Five statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is not in agreement with the requirements of IEC 60567:2011.
- Methane: The determination of this component was not problematic. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is in agreement with the requirements of IEC 60567:2011.
- Ethane: The determination of this component was problematic. Two statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is not in agreement with the requirements of IEC 60567:2011.
- Ethene: The determination of this component was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in agreement with the requirements of IEC 60567:2011.
- Ethyn: The determination of this component was problematic. Two statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is not in agreement with the requirements of IEC 60567:2011.
- Propane: The determination of this component was problematic. The test results of five participants were excluded. These participants detected Propane. After consulting Morgan Schaffer it became clear that Propane was not present in the sample. Ten other participants agreed on a Propane level <10 µl/L. Therefore, no z-scores were calculated.
- Propene: The determination of this component was problematic. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is not in agreement with the requirements of IEC 60567:2011.

#### 4.2 PERFORMANCE EVALUATION FOR THE GROUP OF LABORATORIES

A comparison has been made between the reproducibility as declared by the relevant reference test method and the reproducibility as found for the group of participating laboratories. The number of significant test results, the average result, the calculated reproducibility ( $2.8 * sd$ ) and the target reproducibilities derived from reference test method (in casu IEC60567 test method) are compared in next table.

| Component                             | unit | n  | average | 2.8 * sd | R(lit) |
|---------------------------------------|------|----|---------|----------|--------|
| Hydrogen H <sub>2</sub>               | µl/L | 50 | 533     | 147      | 107    |
| Oxygen O <sub>2</sub>                 | µl/L | 46 | 15499   | 3358     | 3100   |
| Nitrogen N <sub>2</sub>               | µl/L | 50 | 56117   | 18387    | 11223  |
| Carbon Monoxide CO                    | µl/L | 52 | 512     | 141      | 102    |
| Carbon Dioxide CO <sub>2</sub>        | µl/L | 48 | 555     | 143      | 111    |
| Methane CH <sub>4</sub>               | µl/L | 52 | 518     | 111      | 104    |
| Ethane C <sub>2</sub> H <sub>6</sub>  | µl/L | 51 | 536     | 138      | 107    |
| Ethene C <sub>2</sub> H <sub>4</sub>  | µl/L | 50 | 524     | 114      | 105    |
| Ethyn C <sub>2</sub> H <sub>2</sub>   | µl/L | 50 | 510     | 127      | 102    |
| Propane C <sub>3</sub> H <sub>8</sub> | µl/L | 10 | <10     | n.a.     | n.a.   |
| Propene C <sub>3</sub> H <sub>6</sub> | µl/L | 9  | 562     | 194      | 112    |

Table 1: reproducibilities of components on sample #18234

Without further statistical calculations it can be concluded from the overview given in table 1 that for most determinations it is difficult to get a compliance of the performance of the group of participating laboratories with the relevant standard IEC 60567:2011.

The problematic components have been discussed in paragraph 4.1.

#### 4.3 COMPARISON OF THE PROFICIENCY TEST OF NOVEMBER 2018 WITH PREVIOUS PTS

|                                    | <i>November 2018</i> | <i>November 2017</i> | <i>November 2016</i> | <i>November 2015</i> | <i>November 2014</i> |
|------------------------------------|----------------------|----------------------|----------------------|----------------------|----------------------|
| Number of reporting labs           | 53                   | 61                   | 53                   | 45                   | 40                   |
| Number of test results reported    | 496                  | 580                  | 487                  | 401                  | 358                  |
| Number of statistical outliers     | 25                   | 21                   | 57                   | 29                   | 10                   |
| Percentage of statistical outliers | 5.0%                 | 3.6%                 | 11.7%                | 7.2%                 | 2.8%                 |

Table 2: comparison of statistical summary parameters with previous proficiency tests

In proficiency tests, outlier percentages of 3% - 7.5% are quite normal.

The performance of the determinations of the proficiency tests was compared, expressed as relative standard deviation (RSD) of the PTs, see below table.

| Determination                         | November 2018 | November 2017 | November 2016 | November 2015 | November 2014 | IEC605671 |
|---------------------------------------|---------------|---------------|---------------|---------------|---------------|-----------|
| Hydrogen H <sub>2</sub>               | 10%           | 15%           | 10%           | 21%           | 24%           | 7%        |
| Oxygen O <sub>2</sub>                 | 8%            | 12%           | 13%           | 19%           | 18%           | 7%        |
| Nitrogen N <sub>2</sub>               | 12%           | 19%           | 13%           | 16%           | 13%           | 7%        |
| Carbon Monoxide CO                    | 10%           | 16%           | 12%           | 11%           | 12%           | 7%        |
| Carbon Dioxide CO <sub>2</sub>        | 9%            | 15%           | 16%           | 12%           | 17%           | 7%        |
| Methane CH <sub>4</sub>               | 8%            | 12%           | 10%           | 13%           | 18%           | 7%        |
| Ethane C <sub>2</sub> H <sub>6</sub>  | 9%            | 11%           | 12%           | 17%           | 24%           | 7%        |
| Ethene C <sub>2</sub> H <sub>4</sub>  | 8%            | 12%           | 12%           | 12%           | 29%           | 7%        |
| Ethyn C <sub>2</sub> H <sub>2</sub>   | 9%            | 11%           | 12%           | 11%           | 35%           | 7%        |
| Propane C <sub>3</sub> H <sub>8</sub> | n.e.          | 11%           | 9%            | n.e.          | n.e.          | n.e       |
| Propene C <sub>3</sub> H <sub>6</sub> | 12%           | n.e.          | n.e.          | 26%           | 20%           | n.e       |

Table 3: comparison of the relative uncertainties on the various components

The results of the 2018 PT show an improvement compared to the previous years, but did not meet the strict requirements of the target test method.

## 5. DISCUSSION

The consensus values as determined in this PT are compared with the average values from the homogeneity testing by Morgan Schaffer in the following table. From this comparison, it is clear that all consensus values as determined in this PT are very well in line with the values as determined by Morgan Schaffer after the preparation of the syringes.

| Component                            | Average values by Morgan Schaffer in µl/L | Consensus values from participants results in µl/L | Differences in µl/L | Calculated z-scores |
|--------------------------------------|---|--|---------------------|---------------------|
| Hydrogen H <sub>2</sub>              | 518                                       | 533  | 15                  | 0.39                |
| Oxygen O <sub>2</sub>                | 15600                                     | 15499  | -101                | -0.09               |
| Nitrogen N <sub>2</sub>              | 53200                                     | 56117  | 2917                | 0.73                |
| Carbon Monoxide CO                   | 517                                       | 512  | -5                  | -0.14               |
| Carbon Dioxide CO <sub>2</sub>       | 547                                       | 555  | 8                   | 0.20                |
| Methane CH <sub>4</sub>              | 518                                       | 518  | 0                   | 0.00                |
| Ethane C <sub>2</sub> H <sub>6</sub> | 521                                       | 536  | 15                  | 0.39                |
| Ethene C <sub>2</sub> H <sub>4</sub> | 514                                       | 524  | 10                  | 0.27                |

Table 4: comparison of consensus values with values determined by Morgan Schaffer

No statistical differences were observed between the test results of the 50mL syringes and the 100mL syringes. Both the averages and the variabilities for each of the components were in line with each other for both type of syringes. Regarding the extraction method used a vast majority of the participants (83%) used "Head Space".

| 8001 | 100                  | Head Space        |

**APPENDIX 3****Number of participants per country**

7 labs in AUSTRALIA  
3 labs in BELGIUM  
1 lab in BULGARIA  
2 labs in CHINA, People's Republic  
1 lab in CROATIA  
1 lab in FRANCE  
3 labs in GERMANY  
1 lab in GREECE  
1 lab in HONG KONG  
3 labs in INDIA  
2 labs in ITALY  
1 lab in KINGDOM OF BAHRAIN  
1 lab in MALAYSIA  
1 lab in MEXICO  
1 lab in MOROCCO  
1 lab in NETHERLANDS  
1 lab in NIGERIA  
1 lab in PERU  
2 labs in PORTUGAL  
1 lab in QATAR  
4 labs in SAUDI ARABIA  
3 labs in SINGAPORE  
2 labs in SLOVENIA  
1 lab in SOUTH KOREA  
5 labs in SPAIN  
1 lab in SUDAN  
1 lab in SWITZERLAND  
3 labs in UNITED ARAB EMIRATES  
3 labs in UNITED KINGDOM  
1 lab in UNITED STATES OF AMERICA  
1 lab in URUGUAY

## APPENDIX 4

### Abbreviations:

|          |  |
|----------|--|
| C        | = final test result after checking of first reported suspect test result |
| D(0.01)  | = outlier in Dixon's outlier test  |
| D(0.05)  | = straggler in Dixon's outlier test                                      |
| G(0.01)  | = outlier in Grubbs' outlier test  |
| G(0.05)  | = straggler in Grubbs' outlier test                                      |
| DG(0.01) | = outlier in Double Grubbs' outlier test                                 |
| DG(0.05) | = straggler in Double Grubbs' outlier test                               |
| R(0.01)  | = outlier in Rosner's outlier test                                       |
| R(0.05)  | = straggler in Rosner's outlier test                                     |
| E        | = possibly an error in calculations                                      |
| ex       | = test result excluded from statistical evaluations                      |
| n.a.     | = not applicable   |
| n.e.     | = not evaluated  |
| fr.      | = first reported   |
| SDS      | = Safety Data Sheet  |
