## 1 INTRODUCTION

Since 1995, the Institute for Interlaboratory Studies organizes proficiency tests (PT) for Jet Fuel A1 twice per year. In the annual proficiency testing program of 2018/2019, it was decided to continue proficiency tests on Jet Fuel A1 and Jet Fuel Particle Size in accordance with the latest applicable version (November 2018) of the "Aviation Fuel Quality Requirements for Jointly Operated Systems (AFQRJOS)", sometimes referred to as the "Joint Fuelling System Check List for Jet A-1".

In total 102 laboratories from 55 different countries registered for participation in the interlaboratory study for Jet Fuel A1. From these participants to the main round, 44 also participated in the interlaboratory study for Particle Size Distribution. See appendix 4 for the number of participants per country.

In this report, the results of the 2019 Jet Fuel A1 proficiency tests are presented and discussed. This report is also electronically available through the iis website [www.iisnl.com](http://www.iisnl.com).

## 2 SET UP

The Institute for Interlaboratory Studies (iis) in Spijkenisse, the Netherlands, was the organizer of this proficiency test. Sample analyzes for fit-for-use and homogeneity testing were subcontracted to an ISO/IEC 17025 accredited laboratory. For the main round, it was decided to send 2 litres of Jet Fuel A1 labelled #19030 for the analyses according to the latest version of "Joint Fuelling System Check List for Jet A-1". For the Particle Size Distribution round, it was decided to send one 0.5L of Jet Fuel A1, labelled #19031.

The participants were requested to report rounded and unrounded test results. The unrounded test results were preferably used for statistical evaluation.

### 2.1 ACCREDITATION

The Institute for Interlaboratory Studies in Spijkenisse, the Netherlands, is accredited in agreement with ISO/IEC 17043:2010 (R007), since January 2000, by the Dutch Accreditation Council (Raad voor Accreditatie). This PT falls under the accredited scope. This ensures strict adherence to protocols for sample preparation and statistical evaluation and 100% confidentiality of participant's data. Feedback from the participants on the reported data is encouraged and customer's satisfaction is measured on regular basis by sending out questionnaires.

### 2.2 PROTOCOL

The protocol followed in the organization of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' of June 2018 (iis-protocol, version 3.5). This protocol is electronically available through the iis website [www.iisnl.com](http://www.iisnl.com), from the FAQ page.

## 2.3 CONFIDENTIALITY STATEMENT

All data presented in this report must be regarded as confidential and for use by the participating companies only. Disclosure of the information in this report is only allowed by means of the entire report. Use of the contents of this report for third parties is only allowed by written permission of the Institute for Interlaboratory Studies. Disclosure of the identity of one or more of the participating companies will be done only after receipt of a written agreement of the companies involved.

## 2.4 SAMPLES

### 2.4.1 JET FUEL A1 (MAIN)

The necessary bulk material of Jet Fuel A1, approximately 400 litres, was obtained from a local refinery and homogenised in a mixing vessel. From this batch 218 amber glass bottles of one litre were filled, closed with inner and outer caps and labelled #19030. The homogeneity of the subsamples #19030 was checked by the determination of Density at 15°C in accordance with ASTM D4052 on ten stratified randomly selected samples.

|                  | Density at 15°C<br>in kg/m <sup>3</sup> |
|------------------|---|
| Sample #19030-1  | 793.29                                  |
| Sample #19030-2  | 793.34                                  |
| Sample #19030-3  | 793.31                                  |
| Sample #19030-4  | 793.34                                  |
| Sample #19030-5  | 793.31                                  |
| Sample #19030-6  | 793.30                                  |
| Sample #19030-7  | 793.36                                  |
| Sample #19030-8  | 793.32                                  |
| Sample #19030-9  | 793.32                                  |
| Sample #19030-10 | 793.33                                  |

Table 1: homogeneity test results of subsamples #19030

From the above test results, the repeatability was calculated and compared with 0.3 times the corresponding reproducibility of the reference test method in agreement with the procedure of ISO13528, Annex B2 in the next table.

|                            | Density at 15°C<br>in kg/m <sup>3</sup> |
|----------------------------|---|
| r (observed)               | 0.06                                    |
| reference test method      | ASTM D4052:18a                          |
| 0.3 x R (ref. test method) | 0.15                                    |

Table 2: evaluation of repeatability of subsamples #19030

The calculated repeatability was in agreement with 0.3 times the corresponding reproducibility of the reference test method. Therefore, homogeneity of the subsamples #19030 was assumed.

#### 2.4.2 JET FUEL PARTICLE SIZE DISTRIBUTION DETERMINATION (PS)

The bulk material of Jet Fuel A1 for Particle Size Distribution was obtained from a local refinery. Approximately 100 litres bulk material was homogenized. From this material 63 amber glass bottles of 0.5 litres were filled, closed with inner and outer caps and labelled #19031. Each bottle was spiked with 1 ml of Lube oil, enriched with 4 mg/kg Arizona Dust A2. The homogeneity of the subsamples #19031 was checked by the determination of Particle Size Distribution in accordance with IP565 on eight stratified randomly selected samples.

|                 | > 4 µm (c)<br>counts/ml | > 6 µm (c)<br>counts/ml | > 14 µm (c)<br>counts/ml |
|-----------------|-------------------------|-------------------------|--------------------------|
| Sample #19031-1 | 15543                   | 4597                    | 173                      |
| Sample #19031-2 | 16273                   | 4806                    | 180                      |
| Sample #19031-3 | 16373                   | 4836                    | 191                      |
| Sample #19031-4 | 15204                   | 4500                    | 171                      |
| Sample #19031-5 | 15912                   | 4725                    | 190                      |
| Sample #19031-6 | 16061                   | 4749                    | 191                      |
| Sample #19031-7 | 16133                   | 4757                    | 173                      |
| Sample #19031-8 | 16439                   | 4848                    | 182                      |

Table 3: homogeneity test results of subsamples #19031

From the above test results, the repeatabilities were calculated and compared with the corresponding repeatabilities of the reference test method in agreement with the procedure of ISO13528, Annex B2 in the next table.

|                       | > 4 µm (c)<br>counts/ml | > 6 µm (c)<br>counts/ml | > 14 µm (c)<br>counts/ml |
|-----------------------|-------------------------|-------------------------|--------------------------|
| r (observed)          | 1196                    | 339                     | 24                       |
| reference test method | IP565:13                | IP565:13                | IP565:13                 |
| r (ref. test method)  | 1414                    | 808                     | 77                       |

Table 4: evaluation of repeatabilities of subsamples #19031

The calculated repeatabilities were in agreement with the corresponding repeatabilities of the reference test method. Therefore, homogeneity of the subsamples #19031 was assumed.

Depending on the registration to each of the participating laboratories 2 x 1 litre bottle of Jet Fuel A1 labelled #19030 and/or an 0.5 litre bottle of Jet Fuel PS labelled #19031 was/were sent on February 27, 2019. An SDS was added to the sample package.

#### 2.5 STABILITY OF THE SAMPLES

The stability of Jet Fuel A1, packed in the amber glass bottles was checked. The type of bottle was chosen in accordance with ASTM D4306:15. The material has been found sufficiently stable for the period of the proficiency test.

## 2.6 ANALYSES

The participants were requested to determine on sample #19030: Visual Appearance, Total Acidity, Aromatics by FIA, Aromatics by HPLC (in %M/M and %V/V), Color Saybolt (automated and manual), Copper Corrosion (2 hrs at 100°C), Density at 15°C, Distillation (IBP, 10%, 50%, 90% recovered and FBP), Existence Gum (unwashed), Flash Point, Freezing Point, Kinematic Viscosity at -20°C, Mercaptan Sulfur, MSEP, Naphthalenes, Smoke Point, Specific Energy Net on Sulfur free basis and Total Sulfur.

The participants were requested to determine Particle Size Distribution only on sample #19031.

The analyses should be performed according to the "Aviation Fuel Quality Requirements for Jointly Operated Systems (AFQRJOS), version November 2018", also referred to as the "Joint Fuelling System Check List" or simply "Check List".

It was requested to report some analytical details, such as the lotnumber of the FIA indicator and the model of the Particle Size equipment.

It was explicitly requested to treat the samples as if they were routine samples and to report the test results using the indicated units on the report form and not to round the test results, but report as much significant figures as possible. It was also requested not to report 'less than' test results, which are above the detection limit, because such test results cannot be used for meaningful statistical evaluations.

To get comparable test results, a detailed report form and a letter of instructions are prepared. On the report form the reporting units are given as well as the appropriate reference test methods that will be used during the evaluation. The detailed report form and the letter of instructions are both made available on the data entry portal [www.kpmd.co.uk/sgs-iis/](http://www.kpmd.co.uk/sgs-iis/). The participating laboratories are also requested to confirm the sample receipt on this data entry portal. The letter of instructions can also be downloaded from the iis website [www.iisnl.com](http://www.iisnl.com).

## 3 RESULTS

During five weeks after sample dispatch, the test results of the individual laboratories were gathered via the data entry portal [www.kpmd.co.uk/sgs-iis/](http://www.kpmd.co.uk/sgs-iis/). The reported test results are tabulated per determination in appendix 1 of this report. The laboratories are presented by their code numbers.

Directly after the deadline, a reminder was sent to those laboratories that had not reported test results at that moment. Shortly after the deadline, the available test results were screened for suspect data. A test result was called suspect in case the Huber Elimination Rule (a robust outlier test) found it to be an outlier. The laboratories that produced these suspect data were asked to check the reported test results (no reanalysis). Additional or corrected test results are used for data analysis and original test results are placed under 'Remarks' in the test result tables in appendix 1. Test results that came in after the deadline were not taken into account in this screening for suspect data and thus these participants were not requested for checks.

### 3.1 STATISTICS

The protocol followed in the organization of this proficiency test was the one as described for proficiency testing in the report ‘iis Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation’ of June 2018 (iis-protocol, version 3.5).

For the statistical evaluation, the *unrounded* (when available) figures were used instead of the rounded test results. Test results reported as ‘<...’ or ‘>...’ were not used in the statistical evaluation.

First, the normality of the distribution of the various data sets per determination was checked by means of the Lilliefors-test, a variant of the Kolmogorov-Smirnov test and by the calculation of skewness and kurtosis. Evaluation of the three normality indicators in combination with the visual evaluation of the graphic Kernel density plot, lead to judgement of the normality being either ‘unknown’, ‘OK’, ‘suspect’ or ‘not OK’. After removal of outliers, this check was repeated. If a data set does not have a normal distribution, the (results of the) statistical evaluation should be used with due care.

According to ISO 5725 the original test results per determination were submitted to Dixon’s, Grubbs’ and/or Rosner’s outlier tests. Outliers are marked by D(0.01) for the Dixon’s test, by G(0.01) or DG(0.01) for the Grubbs’ test and by R(0.01) for the Rosner’s test. Stragglers are marked by D(0.05) for the Dixon’s test, by G(0.05) or DG(0.05) for the Grubbs’ test and by R(0.05) for the Rosner’s test. Both outliers and stragglers were not included in the calculations of averages and standard deviations.

For each assigned value, the uncertainty was determined in accordance with ISO13528. Subsequently the calculated uncertainty was evaluated against the respective requirement based on the target reproducibility in accordance with ISO13528. In this PT, the criterion of ISO13528, paragraph 9.2.1, was met for all evaluated tests, therefore, the uncertainty of all assigned values may be negligible and need not to be included in the PT report.

Finally, the reproducibilities were calculated from the standard deviations by multiplying them with a factor of 2.8.

### 3.2 GRAPHICS

In order to visualise the data against the reproducibilities from literature, Gauss plots were made, using the sorted data for one determination (see appendix 1). On the Y-axis the reported test results are plotted. The corresponding laboratory numbers are on the X-axis.

The straight horizontal line presents the consensus value (a trimmed mean). The four striped lines, parallel to the consensus value line, are the +3s, +2s, -2s and -3s target reproducibility limits of the selected reference test method. Outliers and other data, which were excluded from the calculations, are represented as a cross. Accepted data are represented as a triangle.

Furthermore, Kernel Density Graphs were made. This is a method for producing a smooth density approximation to a set of data that avoids some problems associated with histograms. Also, a normal Gauss curve was projected over the Kernel Density Graph for reference.

### 3.3 Z-SCORES

To evaluate the performance of the participating laboratories the z-scores were calculated. As it was decided to evaluate the performance of the participants in this proficiency test (PT) against the literature requirements, e.g. ASTM or IP reproducibilities, the z-scores were calculated using a target standard deviation. This results in an evaluation independent of the variation of this interlaboratory study.

The target standard deviation was calculated from the literature reproducibility by division with 2.8. In case no literature reproducibility was available, other targets values were used. In some cases, a reproducibility based on former iis proficiency tests could be used.

When a laboratory did use a test method with a reproducibility that is significantly different from the reproducibility of the reference test method used in this report, it is strongly advised to recalculate the z-score, while using the reproducibility of the actual test method used, this in order to evaluate whether the reported test result is fit-for-use.

The z-scores were calculated according to:

$$Z_{(\text{target})} = (\text{test result} - \text{average of PT}) / \text{target standard deviation}$$

The  $Z_{(\text{target})}$  scores are listed in the test result tables in appendix 1.

Absolute values for  $z < 2$  are very common and absolute values for  $z > 3$  are very rare.  
The usual interpretation of z-scores is as follows:

|               |                |
|---------------|----------------|
| $ z  < 1$     | good           |
| $1 <  z  < 2$ | satisfactory   |
| $2 <  z  < 3$ | questionable   |
| $3 <  z $     | unsatisfactory |

## 4 EVALUATION

In this interlaboratory study, some problems were encountered with sample dispatch to the participants in Nigeria and the Russian Federation.

For the main round Jet Fuel A1, five participants reported the test results after the final reporting date and another nine participants did not report any test results at all. For the Particle Size Distribution round, two participants reported the test results after the final reporting date and another twelve participants did not report any test results at all. Not all laboratories were able to report all analyses requested.

Finally, 93 participants reported in total 1789 numerical test results. Observed were 53 outlying test results, which is 3.0% of the reported numerical test results. In proficiency studies, outlier percentages of 3% - 7.5% are quite normal.

Not all original data sets proved to have a normal Gaussian distribution. These are referred to as "not OK" or "suspect". The statistical evaluation of these data sets should be used with due care.

#### 4.1 EVALUATION PER SAMPLE AND PER TEST

In this section, the reported test results are discussed per sample and per test. The test methods, which were used by the various laboratories, were taken into account for explaining the observed differences where possible and applicable. These test methods are also in the tables together with the reported test results. The abbreviations, used in these tables, are listed in appendix 5.

In the iis PT reports, ASTM test methods are referred to with a number and if appropriate an indication of sub test method (e.g. D1840-B) and an added designation for the year that the test method was adopted or revised (e.g. D1840-B:07). If applicable, a designation in parentheses is added to designate the year of reapproval (e.g. D1840-B:07(2017)). In the test results tables of appendix 1 only the method number and year of adoption or revision e.g. D1840-B:07 will be used.

Since the Joint Fuelling System Check List for Jet-A1 is continuously updated, the participants are advised to monitor the updates. The latest version at the time of this Round Robin is DEF STAN 91-091/Issue 10, dated: September 2018" and ASTM D1655:18b. One must keep in mind that ISO test methods are not mentioned in the "Checklist".

##### Sample #19030

Appearance: All participants agreed that the Visual Appearance of the sample was Clear and Bright.

Acidity, Total: This determination was problematic. Three statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is not in agreement with the requirements of ASTM D3242:11(2017).

Aromatics by FIA: This determination was not problematic. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is in agreement with ASTM D1319:18.

The laboratories were requested to report the lotnumber Fluorescent Indicator Dyed Gel, which was used for the test. Twenty of the thirty-two reporting participants shared the lotnumber of the batch used.

In the latest version of ASTM D1655 (March 2019, issued after this PT was started), there is a remark about the lotnumber of the F.I. Dyed Gel. In paragraph 11.4.14.1 it states: "In analyzing Aviation Turbine Fuel by Test Method D1319 or IP 156, users shall not report results obtained using any of the following lot numbers of Fluorescent Indicator Dyed Gel: 3000000975, 3000000976, 3000000977, 3000000978, 3000000979 and 3000000980".

None of the participants reported one of these lotnumbers, the majority reported a lotnumber lower than these, while a few reported a lotnumber in a very different format. When using one of the above mentioned lotnumbers, the

test results may not be comparable to the test results performed with the earlier lotnumbers. In this PT the precision of the test results is well within the precision of the method. iis will continue to request the lotnumber of the Dyed Gel used in future PTs.

Total Aromatics by HPLC: The determination in %M/M was not problematic. No statistical outliers were observed. The calculated reproducibility is in agreement with ASTM D6379:11.

The determination in %V/V may not be problematic. Two statistical outliers were observed. Regretfully, no precision data for the determination in %V/V is mentioned in ASTM D6379:11. The calculated reproducibility was smaller than the calculated reproducibility in %V/V of the proficiency test iis18J01, but larger than that of iis18J02, both of held in 2018.

Color Saybolt: The determination was very problematic for the automatic test method ASTM D6045. No statistical outliers were observed. However, the calculated reproducibility is not at all in agreement with the requirements of ASTM D6045:12(2017).

The determination for the manual test method ASTM D156 was problematic. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is not in agreement with the requirements of ASTM D156:15.

Copper Corrosion: This determination was not problematic. Sixty-five participants reported a test result and agreed on a result of 1.

Density: This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in agreement with the requirements of ASTM D4052:18a.

Distillation: This determination was not problematic. In total, one statistical outlier was observed. All calculated reproducibilities after rejection of the statistical outlier, except 90% recovered, are in agreement with the automated mode requirements of ASTM D86:18. When compared to the manual mode requirements of ASTM D86:18 only the calculated reproducibilities for 10% rec. and 50% rec. are in agreement.

Existent Gum: This determination was not problematic. Two statistical outlier were observed. However, the calculated reproducibility after rejection of the statistical outliers is in agreement with ASTM D381:12(2017).

Flash Point: This determination was not problematic. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is in full agreement with IP170:14.

Freezing Point: This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in agreement with the requirements of ASTM D2386:18.

Kin. Viscosity at -20°C: This determination was not problematic. Three statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in full agreement with the requirements of ASTM D445:18.

Mercaptan Sulfur: This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in agreement with the requirements of ASTM D3227:16.

MSEP: This determination was problematic. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is not in agreement with the requirements of ASTM D3948:14.

Naphthalenes: This determination was not problematic depending on the procedure used. Three statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in agreement with the requirements of ASTM D1840:07(2017) procedure B. When evaluated separately, both calculated reproducibilities are in agreement with the requirements of the respective procedures of ASTM D1840:07.

Smoke Point: This determination was not problematic depending on test mode used of ASTM D1322:18. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is in agreement with the requirements of the manual mode of ASTM D1322:18, but not with the strict requirements of the automated mode.

Specific Energy: This determination was problematic. No statistical outliers were observed. However, the calculated reproducibility is not in agreement with the requirements of ASTM D3338:09e2(2014). No calculation errors are observed.

Sulfur, Total: This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in full agreement with the requirements of ASTM D5453:16e1.

## Sample #19031

### Particle Size Distribution Determination:

The Joint Fuelling System Check List for Jet-A1 lists test methods IP564, IP565 and IP577 as the reference test methods to determine the Particle Size Distribution in Jet Fuel A1. Over the last few years, iis has observed and concluded that these methods are biased and not as interchangeable as it appears from the checklist. Although no equipment suppliers are mentioned in the test methods, the brand of the automatic particle counter (APC) defines the test method. Therefore, the automatic particle counter (APC) in method IP564 is Parker Hannifin, in method IP565 it is Stanhope-Seta and in method IP577 it is Pamas.

The participants were requested to specify the brand of the particle counter, along with the method for calibration, the actual test method performed and the test method used for determining ISO code scaling. All reporting participants mentioned the equipment used, seven participants used IP564, twenty-four used IP565, one participant used IP577. All participants reported (some after a correction) to have used the method that corresponds with the equipment used. Most participants used ISO11171 for the calibration. All laboratories used ISO4406 for calculating the scale numbers from the counts per ml. Almost all participants calculated the ISO code from the test results in counts/ml correctly.

Again, it was found that the test results of IP564 were significantly lower than those of IP565. This is generally the case, the same is also documented in an article found on internet (see literature reference 4). Therefore, it was decided to evaluate both methods separately. The results of the participants performing IP577 were evaluated in the group of IP565, because the results were more compatible with the results of IP565 than those of IP564 at the particle size distribution found in this PT sample.

IP564: The determination according to IP564 was problematic. In total four statistical outliers were observed and three other test results were excluded for the six particle size categories. All calculated reproducibilities after rejection of the suspect data are not in agreement with the requirements of IP564:13. The determination expressed in ISO scale numbers may be problematic. Three statistical outliers were observed. The calculated reproducibilities after rejection of the statistical outliers are in agreement with the indicative requirements of IP564:13 Annex C, except for  $\geq 4 \mu\text{m}$  (c).

IP565: The determination according to IP565 was problematic. In total twelve statistical outliers were observed and eight other test results were excluded for the six particle size categories. The calculated reproducibilities after rejection of the suspect data are not in agreement with the requirements of IP565:13, except for  $\geq 14 \mu\text{m}$  (c). The determination expressed in ISO scale numbers may be problematic. Three statistical outliers were observed and one other test result was excluded. The calculated reproducibilities after rejection of the suspect data are not in agreement with the indicative requirements of IP565:13 Annex C, except for  $\geq 4 \mu\text{m}$  (c).

## 4.2 PERFORMANCE EVALUATION FOR THE GROUP OF LABORATORIES

A comparison has been made between the reproducibility as declared by the relevant reference test method and the reproducibility as found for the group of participating laboratories. The number of significant test results, the average result, the calculated reproducibility ( $2.8 * \text{standard deviation}$ ) and the target reproducibilities derived from literature reference test methods (in casu ASTM and IP test methods) are compared in the next tables.

| Parameter                     | unit               | n  | average   | $2.8 * \text{sd}$ | R (lit) |

Table 6: reproducibilities of tests on sample #19031 according to IP564

| Parameter - IP565                       | unit      | n  | average | 2.8 * sd | R (lit) |
|---|-----------|----|---------|----------|---------|
| Particle Size $\geq 4 \mu\text{m}$ (c)  | counts/mL | 22 | 15571   | 3214     | 1750    |
| Particle Size $\geq 6 \mu\text{m}$ (c)  | counts/mL | 22 | 4650    | 1232     | 1026    |
| Particle Size $\geq 14 \mu\text{m}$ (c) | counts/mL | 21 | 161     | 92.2     | 91.6    |
| Particle Size $\geq 21 \mu\text{m}$ (c) | counts/mL | 22 | 26.9    | 35.6     | 23.2    |
| Particle Size $\geq 25 \mu\text{m}$ (c) | counts/mL | 21 | 9.5     | 16.0     | 10.5    |
| Particle Size $\geq 30 \mu\text{m}$ (c) | counts/mL | 22 | 3.4     | 7.0      | 4.9     |
| Particle Size $\geq 4 \mu\text{m}$ (c)  | ISO scale | 20 | 21.0    | 0.0      | 1.0     |
| Particle Size $\geq 6 \mu\text{m}$ (c)  | ISO scale | 20 | 19.3    | 1.2      | 1.0     |
| Particle Size $\geq 14 \mu\text{m}$ (c) | ISO scale | 19 | 14.6    | 1.7      | 1.4     |

Table 7: reproducibilities of tests on sample #19031 according to IP565

Without further statistical calculations, it can be concluded that for Particle Size there is not a good compliance of the group of participants with the relevant reference test methods. Problematic tests have been discussed in paragraph 4.1.

#### 4.3 COMPARISON OF THE PROFICIENCY TEST OF MARCH 2019 WITH PREVIOUS PTS

|                                 | March 2019 | September 2018 | March 2018 | September 2017 | March 2017 |
|---------------------------------|------------|----------------|------------|----------------|------------|
| Number of reporting labs        | 93         | 152            | 99         | 144            | 108        |
| Number of test results reported | 1789       | 2678           | 1671       | 2706           | 2091       |
| Number of statistical outliers  | 53         | 57             | 46         | 83             | 63         |
| Percentage outliers             | 3.0%       | 2.1%           | 2.8%       | 3.1%           | 3.0%       |

Table 8: comparison with previous proficiency tests

In proficiency tests outlier percentages of 3% - 7.5% are quite normal.

The performance of the determinations of the proficiency tests was compared against the requirements of the respective reference test methods. The conclusions are given the following table.

| Parameter                    | March 2019 | September 2018 | March 2018 | September 2017 | March 2017 |
|------------------------------|------------|----------------|------------|----------------|------------|
| Acidity, Total               | -          | -              | -          | -              | -          |
| Aromatics by FIA             | +          | +              | +          | +              | +          |
| Aromatics by HPLC, Total     | +          | +              | +          | +/-            | +          |

| Sulfur, Total                | +/-        | -              | +          | -              | +/-        |
| - IP564 cumulative counts/ml | -          | --             | --         | -              | --         |
| - IP564 ISO scale numbers    | +/-        | -              | +          | +/-            | +          |
| - IP565 cumulative counts/ml | -          | --             | --         | -              | -          |
| - IP565 ISO scale numbers    | +/-        | +/-            | -          | +/-            | +          |

Table 9: comparison determinations against the reference test methods

The performance of the determinations against the requirements of the respective reference test methods is listed in the above table. The following performance categories were used:

- ++: group performed much better than the reference test method
- + : group performed better than the reference test method
- +/-: group performance equals the reference test method
- : group performed worse than the reference test method
- : group performed much worse than the reference test method

| 6 labs in FRANCE                  | 1 lab in SOMALIA                    |
| 1 lab in FRENCH GUIANA            | 2 labs in SOUTH AFRICA              |
| 1 lab in GEORGIA                  | 1 lab in SOUTH KOREA                |
| 1 lab in GERMANY                  | 1 lab in SPAIN                      |
| 5 labs in GREECE                  | 1 lab in SUDAN                      |
| 1 lab in GUAM                     | 2 labs in SWEDEN                    |
| 1 lab in HUNGARY                  | 1 lab in TAIWAN                     |
| 1 lab in IRELAND                  | 1 lab in THAILAND                   |
| 3 labs in ITALY                   | 1 lab in TOGO                       |
| 1 lab in LEBANON                  | 1 lab in TURKEY                     |
| 1 lab in LITHUANIA                | 2 labs in UNITED ARAB EMIRATES      |
| 1 lab in MALAYSIA                 | 3 labs in UNITED KINGDOM            |
| 1 lab in MALTA                    | 10 labs in UNITED STATES OF AMERICA |
| 1 lab in MARTINIQUE               |                                     |

## APPENDIX 5

### Abbreviations:

|                 |  |
|-----------------|--|
| C               | = final test result after checking of first reported suspect test result |
| D(0.01)         | = outlier in Dixon's outlier test  |
| D(0.05)         | = straggler in Dixon's outlier test                                      |
| G(0.01), G(1)   | = outlier in Grubbs' outlier test  |
| G(0.05), G(5)   | = straggler in Grubbs' outlier test                                      |
| DG(0.01), DG(1) | = outlier in Double Grubbs' outlier test                                 |
| DG(0.05), DG(5) | = straggler in Double Grubbs' outlier test                               |
| R(0.01), R(1)   | = outlier in Rosner's outlier test                                       |
| R(0.05), R(5)   | = straggler in Rosner's outlier test                                     |
| E               | = possibly an error in calculations                                      |
| W               | = test result withdrawn on request of participant                        |
| ex              | = test result excluded from statistical evaluation                       |
| fr.             | = first reported   |
| n.a.            | = not applicable   |
| n.e.            | = not evaluated  |
| n.d.            | = not detected   |
| SDS             | = Safety Data Sheet  |
