4.	Abbreviations and literature	39

#### 1 Introduction

Since 2001 the Institute for Interlaboratory Studies (iis) organizes a proficiency scheme for the analysis of Transformer Oil (fresh) every year. During the annual proficiency testing program of 2020/2021, it was decided to continue with the proficiency test on Transformer Oil (fresh) in accordance with the latest applicable version of the specification IEC60296 and ASTM D3487.

In this interlaboratory study 65 laboratories in 31 different countries registered for participation. See appendix 3 for the number of participants per country. In this report the results of this proficiency test are presented and discussed. This report is also electronically available through the iis website www.iisnl.com.

### 2 SET UP

The Institute for Interlaboratory Studies (iis) in Spijkenisse, the Netherlands, was the organizer of this proficiency test (PT). Sample analyses for fit-for-use and homogeneity testing were subcontracted to an ISO/IEC17025 accredited laboratory. It was decided to send one bottle of 1L labelled #20225 of Transformer Oil (fresh). The participants were requested to report rounded and unrounded test results. The unrounded test results were preferably used for statistical evaluation.

#### 2.1 ACCREDITATION

The Institute for Interlaboratory Studies in Spijkenisse, the Netherlands, is accredited in agreement with ISO/IEC17043:2010 (R007), since January 2000, by the Dutch Accreditation Council (Raad voor Accreditatie). This PT falls under the accredited scope. This ensures strict adherence to protocols for sample preparation and statistical evaluation and 100% confidentiality of participant's data. Feedback from the participants on the reported data is encouraged and customer's satisfaction is measured on regular basis by sending out questionnaires.

### 2.2 PROTOCOL

The protocol followed in the organization of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organization, Statistics and Evaluation' of June 2018 (iis-protocol, version 3.5). This protocol is electronically available through the iis website www.iisnl.com, from FAQ page.

### 2.3 CONFIDENTIALITY STATEMENT

All data presented in this report must be regarded as confidential and for use by the participating companies only. Disclosure of the information in this report is only allowed by means of the entire report. Use of the contents of this report for third parties is only allowed by written permission of the Institute for Interlaboratory Studies. Disclosure of the identity of one or more of the participating companies will be done only after receipt of a written agreement of the companies involved.

#### 2.4 SAMPLES

Approximately 80 liters of Transformer Oil (fresh) was obtained from a local supplier. After homogenization the batch was divided over 78 subsamples in amber glass bottles of 1 liter and labelled #20225.

The homogeneity of the subsamples was checked by the determination of Density at 20°C in accordance with ASTM D4052 on 8 stratified randomly selected subsamples.

	Density at 20°C in kg/m³
Sample #20225-1	867.28
Sample #20225-2	867.29
Sample #20225-3	867.24
Sample #20225-4	867.24
Sample #20225-5	867.24
Sample #20225-6	867.25
Sample #20225-7	867.26
Sample #20225-8	867.28

Table 1: homogeneity test results of subsamples #20225

From the above test results the repeatability was calculated and compared with 0.3 times the reproducibility of the reference test method in agreement with the procedure of ISO13528, Annex B2 in the next table.

	Density at 20°C in kg/m³
r (observed)	0.06
reference test method	ISO3675:98
0.3 x R (reference test method)	0.36

Table 2: evaluation of the repeatability of subsamples #20225

The calculated repeatability was in agreement with 0.3 times the reproducibility of the reference test method. Therefore, homogeneity of the subsamples was assumed.

To each of the participating laboratories 1 bottle of 1L labelled #20225 was sent on October 28, 2020. An SDS was added to the sample package.

#### 2.5 STABILITY OF THE SAMPLES

The stability of Transformer Oil (fresh) packed in amber glass bottles was checked. The material was found sufficiently stable for the period of the proficiency test.

#### 2.6 ANALYZES

The participants were requested to determine on sample #20225: Total Acidity (Potentiometric and Colorimetric), Appearance, Breakdown Voltage, Color ASTM, Density at 20°C, Di-electric loss at 90°C (Di-electric Dissipation Factor and Specific Resistance), Flash Point (C.O.C. and PMcc), Interfacial Surface Tension, Kinematic Viscosity at 40°C, Water and Additives (DBP, DBPC, DBDS, BTA and Irgamet 39). Also, an extra question regarding stirring during the determination of the Breakdown Voltage were requested.

It was explicitly requested to treat the sample as if it was a routine sample and to report the test results using the indicated units on the report form and not to round the test results but report as much significant figures as possible. It was also requested not to report 'less than' results, which are above the detection limit, because such test results cannot be used for meaningful statistical evaluations.

To get comparable test results, a detailed report form and a letter of instructions are prepared. On the report form the reporting units are given as well as the reference test methods (when applicable) that will be used during the evaluation. The detailed report form and the letter of instructions are both made available on the data entry portal www.kpmd.co.uk/sgs-iis/. The participating laboratories are also requested to confirm the sample receipt on this data entry portal. The letter of instructions can also be downloaded from the iis website www.iisnl.com.

#### 3 RESULTS

During five weeks after sample dispatch the results of the individual laboratories were gathered via the data entry portal www.kpmd.co.uk/sgs-iis/. The reported test results are tabulated per determination in appendices 1 and 2 of this report. The laboratories are presented by their code numbers.

Directly after the deadline, a reminder was sent to those laboratories that had not reported test results at that moment. Shortly after the deadline, the available test results were screened for suspect data. A test result was called suspect in case the Huber Elimination Rule (a robust outlier test) found it to be an outlier. The laboratories that produced these suspect data were asked to check the reported test results (no reanalysis). Additional or corrected test results are used for data analysis and original test results are placed under 'Remarks' in the result tables in appendix 1 or 2. Test results that came in after the deadline were not taken into account in this screening for suspect data and thus these participants were not requested for checks.

#### 3.1 STATISTICS

The protocol followed in the organization of this proficiency test was the one as described for proficiency testing in the report 'iis Interlaboratory Studies: Protocol for the Organisation, Statistics and Evaluation' of June 2018 (iis-protocol, version 3.5).

For the statistical evaluation the *unrounded* (when available) figures were used instead of the rounded test results. Test results reported as '<...' or '>...' were not used in the statistical evaluation.

First, the normality of the distribution of the various data sets per determination was checked by means of the Lilliefors-test, a variant of the Kolmogorov-Smirnov test and by the calculation of skewness and kurtosis. Evaluation of the three normality indicators in combination with the visual evaluation of the graphic Kernel density plot, lead to judgement of the normality being either 'unknown', 'OK', 'suspect' or 'not OK'. After removal of outliers, this check was repeated. If a data set does not have a normal distribution, the (results of the) statistical evaluation should be used with due care.

According to ISO5725 the original test results per determination were submitted to Dixon's, Grubbs' or Rosner's outlier tests. Outliers are marked by D(0.01) for the Dixon's test, by G(0.01) or DG(0.01) for the Grubbs' test and by R(0.01) for the Rosner's test. Stragglers are marked by D(0.05) for the Dixon's test, by G(0.05) or DG(0.05) for the Grubbs' test and by R(0.05) for the Rosner's test. Both outliers and stragglers were not included in the calculations of averages and standard deviations.

For each assigned value, the uncertainty was determined in accordance with ISO13528. Subsequently the calculated uncertainty was evaluated against the respective requirement based on the target reproducibility in accordance with ISO13528. In this PT, the criterion of ISO13528, paragraph 9.2.1, was met for all evaluated tests, therefore, the uncertainty of all assigned values may be negligible and need not be included in the PT report.

Finally, the reproducibilities were calculated from the standard deviations by multiplying them with a factor of 2.8.

#### 3.2 GRAPHICS

In order to visualize the data against the reproducibilities from literature, Gauss plots were made, using the sorted data for one determination (see appendix 1). On the Y-axis the reported test results are plotted. The corresponding laboratory numbers are on the X-axis.

The straight horizontal line presents the consensus value (a trimmed mean). The four striped lines, parallel to the consensus value line, are the +3s, +2s, -2s and -3s target reproducibility limits of the selected reference test method. Outliers and other data, which were excluded from the calculations, are represented as a cross. Accepted data are represented as a triangle.

Furthermore, Kernel Density Graphs were made. This is a method for producing a smooth density approximation to a set of data that avoids some problems associated with histograms. Also, a normal Gauss curve was projected over the Kernel Density Graph for reference.

### 3.3 Z-SCORES

To evaluate the performance of the participating laboratories the z-scores were calculated. As it was decided to evaluate the performance of the participants in this proficiency test (PT) against the literature requirements, e.g. ISO, EN or ASTM reproducibilities, the z-scores were calculated using a target standard deviation. This results in an evaluation independent of the variation in this interlaboratory study.

The target standard deviation was calculated from the literature reproducibility by division with 2.8. In case no literature reproducibility was available, other target values were used. In some cases, a reproducibility based on former iis proficiency tests could be used. When a laboratory did use a test method with a reproducibility that is significantly different from the reproducibility of the reference test method used in this report, it is strongly advised to recalculate the z-score, while using the reproducibility of the actual test method used, this in order to evaluate whether the reported test result is fit-for-use.

The z-scores were calculated according to:

```
z_{\text{(target)}} = \text{(test result - average of PT)} / \text{target standard deviation}
```

The  $z_{(target)}$  scores are listed in the result tables of appendix 1. Absolute values for z<2 are very common and absolute values for z>3 are very rare. The usual interpretation of z-scores is as follows:

```
|z| < 1 good
1 < |z| < 2 satisfactory
2 < |z| < 3 questionable
3 < |z| unsatisfactory
```

### 4 EVALUATION

In this proficiency test no major problems were encountered with the dispatch of the samples. One participant reported the test results after the final reporting date and six participants did not report any test results at all. Not all participants were able to report test results for all analyses requested.

In total 59 participants reported 404 numerical test results. Observed were 28 outlying test results, which is 6.9% of the numerical test results. In proficiency studies, outlier percentages of 3% - 7.5% are quite normal.

Not all original data sets proved to have a normal Gaussian distribution. These are referred to as "not OK" or "suspect". The statistical evaluation of these data sets should be used with due care, see also paragraph 3.1.

### 4.1 EVALUATION PER TEST

In this section the reported test results are discussed per test. The test methods which were used by the various laboratories were taken into account for explaining the observed differences when possible and applicable. These test methods are also in the tables together with the reported test results in appendix 1. The abbreviations, used in these tables, are explained in appendix 4.

In the iis PT reports ASTM methods are referred to with a number (e.g. D1500) and an added designation for the year that the method was adopted or revised (e.g. D1500:12). If applicable, a designation in parentheses is added to designate the year of reapproval (e.g. D1500:12(2017)). In the results tables of appendix 1 only the method number and the year of adoption or revision (e.g. D1500:12) will be used.

- Total Acidity (Potentiometric): The total Acidity was below the quantification limit of 0.014 mg KOH/g as given in test method EN62021-1:03. Therefore, no z-sores were calculated.
- Total Acidity (Colorimetric): This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in agreement with the requirements of ASTM D974:14e2.

#### The determination was not problematic. All reporting laboratories agreed on Appearance: the appearance of the oil being 'Clear and Bright' or remarked in similar

words to this.

Breakdown Voltage: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in agreement with the requirements of EN60156:95.

> In the PT of 2018 the difference in consensus value between stirring and not stirring was not significant. In this PT and the PT of 2019, the difference was larger and significant. However, it was decided to calculate the assigned value over all test results as stirring and not stirring is allowed per EN60156:95 and the reproducibility of the group is in agreement with the requirements of test method EN60156:95.

> The reproducibility of EN60156:95 was determined from Figure 3 of method EN60156:95, according to the iis memo 1702 (see lit. 17).

Color ASTM:

This determination was not problematic. One statistical outlier was observed. The calculated reproducibility after rejection of the statistical outlier is in agreement with the requirements of ASTM D1500:12(2017). Please note: the test values reported as "text" (e.g. L0.5) were converted to a numerical value before calculating z-scores, see also appendix 1.

Density at 20°C: This determination was problematic for a number of participants. Ten statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in agreement with the requirements of ISO3675:98.

**DD-Factor**:

This determination was not problematic. Two statistical outliers were observed. However, the calculated reproducibility after rejection of the statistical outliers is in agreement with the requirements of EN60247:04.

Specific Resistance: This determination was problematic. Three statistical outliers were observed and one other test result was excluded. The calculated reproducibility after rejection of the suspect data is not in agreement with the requirements of EN60247:04.

> Please note that it is well known that specific resistance of new oils can vary over a wide range. This is due to randomly tiny amounts of impurities (maybe present in the air or in the test cell) which can dramatically change the value. In used oils, however, due to already present ion flow of the polar compounds, these problems are not observed.

Water:

<u>Flash Point COC</u>: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in agreement with the requirements of ASTM D92:18.

<u>Flash Point PMcc</u>: This determination was not problematic. No statistical outliers were observed. The calculated reproducibility is in agreement with the requirements of ISO2719-A:16.

Interfacial Surface Tension: This determination was problematic. Two statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is not in agreement with the requirements of ASTM D971:20.

<u>Kinematic Viscosity:</u> This determination was problematic depending on the test method used. Five statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is not in agreement with the requirements of ASTM D445:19 and ISO3104:94.

This determination was not problematic. Three statistical outliers were observed. The calculated reproducibility after rejection of the statistical outliers is in agreement with the requirements of EN60814:97.

Antioxidant additives: The majority of the participants agreed that DBP (2,6-Di-tertiary-butyl phenol), DBPC (2,6-Ditertiary-butyl paracresol) DBDS (Dibenzyl disulphide), BTA (Benzotriazole) and Irgamet 39 were below the level of quantification. Therefore, these components were not further evaluated. The reported test results are given in appendix 2.

### 4.2 PERFORMANCE EVALUATION FOR THE GROUP OF LABORATORIES

A comparison has been made between the reproducibility as declared by the reference test method and the reproducibility as found for the group of participating laboratories. The number of significant test results, the average, the calculated reproducibility (2.8 \* standard deviation) and the target reproducibility derived from literature reference test methods (e.g. ASTM, EN and ISO test methods) are presented in the next table.

Parameter	unit	n	average	2.8 * sd	R(lit)
Total Acidity (Potentiometric)	mg KOH/g	23	0.006	0.011	(0.002)
Total Acidity (Colorimetric)	mg KOH/g	18	0.006	0.010	0.04
Appearance		36	C&B	n.a.	n.a.
Breakdown Voltage	kV/2.5 mm	51	66.1	32.2	45.3
Color ASTM		38	0.22	0.36	1
Density at 20°C	kg/m³	35	836.91	1.06	1.2
Di-electric Dissipation Factor 90°C		36	0.0006	0.0012	0.0016
Specific Resistance at 90°C	GΩm	28	720	1682	756
Flash Point C.O.C.	°C	19	156.6	13.0	18
Flash Point PMcc	°C	35	146.1	9.4	10.4

Transformer Oil (fresh): iis20L10

Parameter	unit	n	average	2.8 * sd	R(lit)
Interfacial Surface Tension	mN/m	33	46.2	6.0	4.6
Kinematic Viscosity at 40°C	mm²/s	37	9.03	0.15	0.11
Water	mg/kg	38	10.7	4.7	4.9

Table 3: reproducibilities of tests on sample #20225

Results between brackets were near or below detection limit, these results should be used with care C&B = Clear and Bright

Without further statistical calculations, it can be concluded that for most tests there is a good compliance of the group of participating laboratories with the relevant reference test methods. The problematic tests have been discussed in paragraph 4.1.

### 4.3 COMPARISON OF THE PROFICIENCY TEST OF NOVEMBER 2020 WITH PREVIOUS PTS

	November 2020	November 2019	November 2018	November 2017	November 2016
Number of reporting laboratories	59	48	50	55	51
Number of test results	404	377	371	405	383
Number of statistical outliers	28	24	24	18	29
Percentage of statistical outliers	6.9%	6.4%	6.5%	4.4%	7.6%

Table 4: comparison with previous proficiency tests

In proficiency tests, outlier percentages of 3% - 7.5% are quite normal.

The performance of the determinations of the proficiency tests was compared against the requirements of the reference test methods. The conclusions are given the following table.

Parameter	November 2020	November 2019	November 2018	November 2017	November 2016
Total Acidity (Potentiometric)	()	()	()	()	()
Total Acidity (Colorimetric)	++	++	++	++	++
Breakdown Voltage	+	+	+/-	-	++
Color ASTM	++	++	n.e.	n.e.	n.e.
Density at 20°C	+	+	++	++	++
Di-electric Dissipation Factor	+	+	+ +		+
Specific Resistance		-	-		
Flash Point C.O.C.	+	+ +		-	+/-
Flash Point PMcc	+/-	+ +		+/-	+
Interfacial Surface Tension	-	+/-	+/-	-	+/-
Kinematic Viscosity at 40°C	-	-	+/-	-	+/-
Water	+/-	-	+/-	-	+/-
DBPC Antioxidant Additive	n.e.	n.e.	+	+/-	n.e.

Table 5. comparison of group performances against the reference test methods

Results between brackets were near or below detection limit, these results should be used with care

The performance of the determinations against the requirements of the reference test methods is listed in the above table. The following performance categories were used:

++ : group performed much better than the reference test method

+ : group performed better than the reference test method

+/- : group performance equals the reference test method

- : group performed worse than the reference test method

-- : group performed much worse than the reference test method

n.e. : not evaluated

**APPENDIX 2** 

Determination of 2,6-Ditertiary-butyl phenol (DBP) and 2,6-Ditertiary-butyl paracresol (DBPC); results in %M/M and determination of Dibenzyl disulphide (DBDS), Benzotriazole (BTA) and Irgamet 39; results in mg/kg, all on sample #20225

### **APPENDIX 3**

### Number of participants per country

- 4 labs in AUSTRALIA
- 3 labs in BELGIUM
- 3 labs in BULGARIA
- 2 labs in CHINA, People's Republic
- 1 lab in FRANCE
- 4 labs in GERMANY
- 2 labs in GREECE
- 1 lab in HONG KONG
- 3 labs in INDIA
- 2 labs in ITALY
- 1 lab in KUWAIT
- 1 lab in MALAYSIA
- 1 lab in MOROCCO
- 1 lab in NETHERLANDS
- 1 lab in NEW ZEALAND
- 9 labs in PAKISTAN
- 1 lab in PHILIPPINES
- 1 lab in POLAND
- 1 lab in PORTUGAL
- 3 labs in SAUDI ARABIA
- 3 labs in SINGAPORE
- 1 lab in SLOVENIA
- 1 lab in SOUTH AFRICA
- 2 labs in SOUTH KOREA
- 2 labs in SPAIN
- 1 lab in SWEDEN
- 1 lab in SWITZERLAND
- 1 lab in TURKEY
- 4 labs in UNITED ARAB EMIRATES
- 2 labs in UNITED KINGDOM
- 2 labs in UNITED STATES OF AMERICA

#### **APPENDIX 4**

#### **Abbreviations**

C = final test result after checking of first reported suspect test result

 $\begin{array}{ll} D(0.01) &= \text{outlier in Dixon's outlier test} \\ D(0.05) &= \text{straggler in Dixon's outlier test} \\ G(0.01) &= \text{outlier in Grubbs' outlier test} \\ G(0.05) &= \text{straggler in Grubbs' outlier test} \\ DG(0.01) &= \text{outlier in Double Grubbs' outlier test} \\ DG(0.05) &= \text{straggler in Double Grubbs' outlier test} \\ \end{array}$ 

R(0.01) = outlier in Rosner's outlier test R(0.05) = straggler in Rosner's outlier test

E = calculation difference between reported test result and result calculated by iis

W = test result withdrawn on request of participant ex = test result excluded from statistical evaluation

fr. = first reported
n.a. = not applicable
n.e. = not evaluated
n.d. = not detected
SDS = Safety Data Sheet
